

The Relay to Refurbishment

On Oct. 15, OPG will initiate the first step in the refurbishment of its four reactors at the Darlington Nuclear Generating Station, but the countdown to execution is only part of the plan.

As the largest clean energy project in Canada, Darlington Refurbishment consists of numerous critical tasks that must be scheduled and completed in proper alignment — one action handing over to the other in a 112-month relay. The timeline shown is an overview of the detailed schedule OPG has developed in collaboration with its vendor partners, to ensure all reactors are successfully refurbished safely, with quality, on budget and on time.
