- Construction Quality Assurance Plan.

(This form is part of material receipt docs.)
Appendix C: Quality Surveillance Personnel Qualification & Training

Quality Surveillance Evaluator (QSE) should be familiar with the surveillance process covered in the NR Quality Plan and the NR Quality Surveillance Guide. N-JTA-901-00011, Comprehensive Training Needs Analysis for Quality Management Performance Reporting for Darlington Refurbishment discusses training required with reference to N-TQD-901-00001, Nuclear Refurbishment Training and Qualification. Also the following are other training items if not included in the JTA or N-TQD.

1. Nuclear General Employee Training (NGET) Qualification # 2834
2. Introduction to CANDU CBT (PEL # 3520)
3. Self-study to have adequate familiarity with the Engineering Change Control Process and Design Management (N-PROC-MP-0090)
4. Self-study to get familiarised with the Managed System Governance framework and how to identify governing and supporting documents on specific topics (N-PROC-AS-0001)
5. Self-study to have familiarity with the SCR process and Action Tracking System module of Asset Suite (N-PROC-RA-0022, and N-PROC-AS-0019)
6. Self-study to gain an understanding of the self-assessment process (N-PROC-RA-0097)
7. Self study of Inspection and Test Plan processes as applicable to the different phases of the project.
8. Self-study of Supply Chain processes such as the ones on Receiving Inspection, and Source Surveillance

Following traits or characteristics are recommended to identify as an effective Quality System Evaluator.

a) **Communication skills** required to communicate findings and recommendations as applicable
b) **Credibility and respect.** The effectiveness of the quality surveillance depends strongly on the credibility and respect the functional area personnel may have for the person performing surveillance.

c) **Objectivity:** Ability to focus on the task assigned and be objective in the evaluation.
d) **Ability to make decision / judgement:** Ability to make a judgement conforming requirements.
e) **Ability to deal with people effectively:** Ability to address a confrontational issue or elevate to the appropriate line management.
f) **Ability to take constructive criticism:** Use of constructive criticism to improve the surveillance observations.
g) **Ability to listen:** The Surveillance person to be attentive to the person speaking, by being a good listener.
h) **Ability to ask questions**: asking the right question at the right time and in the proper manner

**Ability to observe and make evaluations**: The person performing surveillance must have good observation skills and be able to make intelligent evaluations.
Appendix D: Preparing and Developing Quality Surveillance Checklists during the Different Phases

A General tips while preparing for Quality Surveillance
Preparation of surveillance checklist is considered the most important part of surveillance preparation. Given below are some tips to be considered for Quality Surveillance.

- Items to be verified are identified from the review of documents in preparation of the surveillance. These documents could include applicable governing documents, procedure for the product activity being covered by the surveillance.
- Items to be verified based on the performance history, problems identified earlier etc.
- Items to be verified based on the critical process activities involved in the specific engineering product, and their acceptance criteria.
- Items to be verified as evidence of quality planning, as applicable to the specific engineering process/product.
- Items to be verified as evidence of in-process quality control.
- Items to be verified as evidence of corrective actions and preventive actions and their effectiveness.
- Items to be verified as evidence of having complied with the applicable code requirements.
- Use of OPEX and lessons learned as applicable to activity being covered by surveillance.
- Any other items identified during the preparation for Quality surveillance.

Note: When verifying evidence of each element for compliance. Make sure that observations are based on a representative sample.

B Quality Surveillance activities during Design:
As identified in N-GUID-01920-10000, Guideline for Engineering Oversight, in-process engineering review and release for further work occurs at the following hold points:

- Engineering Mobilization Hold Point
- Design Plan Hold Point
- COMS Hold Point
- 40% and 85% Design Review, as identified in Design Plan
- Independent Technical Review / Design Challenge Hold Point (as identified in the Mod Out Line)
- Design Completion Assurance Hold Point (DCAVR)
- EC Release Hold Point
- Construction Completion Declaration Hold Point
- Available for Service Hold Point
While the above reviews as part of activities during the above hold points provide for quality checks as part of the process, specific quality surveillance checks are to be taken periodically to confirm compliance with applicable requirements making use of the following:
(i) The Designer’s ECC Job Aid (N-FORM-11443), and N-PROC-MP-90 with its supporting Guide document.
(ii) QA records as identified in N-PROC-MP-0090, Modification Process are listed below:

<table>

</table>
Specific quality surveillance activities may be selected based on the issues identified through SCRs, self-assessments, or other project oversight activities. Such quality surveillances should focus on looking for evidence that demonstrates compliance to key requirements as applicable to the specific product deliverable(s), their preparation, review and verification, or the records management as applied to them.

For every Quality Surveillance, a Surveillance Plan with applicable checklist will be developed. An example of a Design Change Package checklist for Design Completion Assurance is provided in Appendix G.

C Quality Surveillance/ Oversight activities by Refurbishment Supply Chain are carried out by the Nuclear Refurbishment Supply Chain organization following the process described in N-GUID-09701-10022, Supply Chain Oversight.

The current focus of NR Supply Chain Oversight is the following:
- Procurement Planning
- Bid Evaluation
- Selection of sub-contractors by a Supplier
- Review of procurement documents before release
- COIR Clauses related pre award and post award activities
- Manufacturing process
- Post delivery/Materials management

Activities selected for oversight/surveillance are selected from
(i) The Schedule of various procurement activities
(ii) Witness Points identified on ITP by Contractor/ OPG.

Based on the NR Management needs, surveillance activities other than the ones mentioned above may be taken up as directed by NR Management.
D Quality Surveillance activities during Lay-Up

Quality Surveillance during lay-up will verify compliance to the requirements identified in the lay-up plans and lay-up Technical Requirements, and the specific Lay-up Requirements Traceability Matrix.

A Quality Surveillance checklist will be prepared using the lay-up plans for the specific system. A sample checklist is provided in Appendix H.

E Quality Surveillance activities during Construction/Field Execution:

Field Execution Completion Assurance/Quality Surveillance organization is expected to conduct quality surveillance using the related processes and available checklists as discussed in the Governing and supporting documents such as the ones listed below:

- N-MAN-01983-10000, Field Engineering Quality Control Manual
- N-GUID-01983-10000, Field Engineering Guide to Planning and Assessing Work
- N-GUID-01983-10002, Guide to Field Engineering Design Interface and Support
- N-GUID-01983-10004, Field Engineering Quality Control Mechanical
- N-GUID-01983-10005, Field Engineering Quality Control Electrical and Control
- N-GUID-01983-10003, Field Engineering Quality Control Civil
- N-GUID-09701-10120, Guideline for Construction Oversight

A Quality Surveillance checklist for Comprehensive Work Packages and for verifying Construction Completion are provided in Appendix-I and Appendix-J.

Note:

The checklist for the specific situation would vary and will be based on the type of equipment and the work carried out, including verification of completed Inspection and Test Plan.

Detailed Quality Surveillance Checklists will be prepared based on the Inspection and Test Plans for the work execution of the specific job and the referenced documents.

It will include checking the completion and verification of ITP activities to meet the specified criteria as well as evidence of having recorded the required details to demonstrate compliance applicable to witness and hold points.

For Non-Modification Jobs:

In the case of non-modification jobs such as Maintenance Predefines, and other rehabilitation jobs, inspection and test plans referenced in the work package or the task instructions identified in the Work Order task instructions will be used.

Additional Quality surveillance may be carried out by the Refurbishment Quality Management Organization on a sample basis making use of the checklists being used by Field Execution organization.

F Quality Surveillance during Commissioning

Specific checklist for use with Commissioning will be prepared making use of the following:
The system specific Commissioning Specifications and Commissioning Reports prepared in accordance with N-INS-00960-10000, Detailed Commissioning Specifications and Commissioning Reports. A generic Checklist is provided in Appendix K:

**G Quality Surveillance at AFS**

Depending on whether the system (i) remained in normal service with no modification or component replacement (ii) was placed in a desired lay-up or shutdown state according to operating procedures (iii) was modified, the checks to be conducted would vary. While the Quality Surveillance checklists for a specific system AFS would be prepared considering the above and the specifics as applicable to the system, a generic checklist for the situation when the system was modified is given in Appendix L.

**H Quality Surveillance at Unit Readiness**

Sample checklist for quality surveillance at Unit Readiness is given in Appendix M:

Once the related processes documents are finalized, this draft sample checklist will be updated incorporating input from Refurbishment Operations.

**J Quality Surveillance during Closeout**

Quality Surveillance during Closeout will be mostly with respect to documents that are required and resulting from the Engineering and Field Execution processes that lead to final stage of Closeout.

Surveillance activities will be planned and carried out involving the respective functional organizations and involving the Records Management Personnel. Checklists as applicable to the context will be prepared based on the focus of surveillance. A generic sample checklist is discussed in Appendix N.

**Reviewed and Approved by:**

Note: If required, a Form Number would be created before finalizing this guide document.
Appendix F: Quality Surveillance Reporting Template

Details from Quality Surveillance are to be documented in the Oversight part of the Risk Management and Oversight (RMO) tool covering the following items and the fields available in the RMO tool.

- Date(s) on which the surveillance was performed, location,
- Identification of the QSE(s), who conducted the quality surveillance
- Description of the activity observed
- Summary of observations (Summary Report)
- Key issues: Concise statements on issues observed and findings, if any
- Station Condition Record # (if applicable)

Note: Refer to N-GUID-09701-10123, Nuclear Projects Risk Management and Oversight (RMO) Tool, and the associate document, Frequently Asked Questions and Answers.

**Master EC Package: General**

1. **Modification Design Requirement**
   - Yes
   - No
   - Not Applicable
   - Remarks: Prepared in accordance with N-INS-00700-10007

2. **Mod Out Line (N-FORM-10958), Along with the required Forms, applicable (listed below)**
   - Yes
   - No
   - Not Applicable
   - Remarks: Completed with the required signatures.

2 a. **Design Scoping Checklist N-FORM-10959, (completed with signatures)**
   - Yes
   - No
   - Not Applicable
   - Remarks: As part of MEC, (updated with each released Design EC, when several DECs are involved and released at different times.)

2 b. **Document Scoping Checklist N-FORM-10521.**
   - Yes
   - No
   - Not Applicable
   - Remarks: (Same as above)

2 c. **Prestart Health & Safety Review – N-FORM-10853. (completed with signatures)**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable.

2 d. **Pressure Boundary Designers Checklist N-FORM-10528**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable. If it is clearly known as PB related package the use of checklist may not be required.

2 e. **CNSC Approval & Notification Screening (N-FORM-10369)**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable, as identified in the Design Scoping Checklist

2 f. **Chemistry Design Change checklist (N-FORM-10560)**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable.

2 g. **Fire Protection Impact Evaluation (N-FORM-10287)**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable.

2 h. **Environment Impact Worksheet N-FORM-10422**
   - Yes
   - No
   - Not Applicable
   - Remarks: If applicable

2 i. **Reactor safety Designer’s checklist N-FORM-10529**
   - Yes
   - No
   - Not Applicable
   - Remarks: As applicable

2 j. **Human Factor Level of Activity Determination (N-FORM-10580)**
   - Yes
   - No
   - Not Applicable
   - Remarks: As applicable

3. **Design Plan updated with DA approval.**
   - Yes
   - No
   - Not Applicable
   - Remarks: In accordance with N-PROC-MP-0074, with required signatures.

4. **Value Engineering Report**
   - Yes
   - No
   - Not Applicable
   - Remarks: As applicable, based on accepted deviations or already completed by OPG as part of MDP Package.

**Note:**

- **(i)** Key point to note is that the ITP lists the inspections, tests, and verifications for the product or services specified in the contract, to demonstrate quality is built/requirements are met during execution.

**Refer to procedural documents such as N-INS-01913.11-10006, as well as ITP requirements identified in QA standards such as Z 299.0. The verification also to include if the ITP was reviewed and accepted as identified in the COIR.**

- **(ii)** The Construction completion/work execution checklist will also include control of material during fabrication and up to installation.

**Note:**

- In case welding jobs are involved, appropriate checklist with specific checks applicable to the type of welding, and welding material/consumable control will be included.

- The Construction completion/work execution checklist will also include control of material during fabrication and up to installation.

---

**Note:**

Detailed Quality Surveillance Checklists will be prepared based on the Inspection and Test Plans for the work execution of the specific job.

It will include checking the completion and verification of ITP activities to meet the specified criteria as well as evidence of having recorded the required details to demonstrate compliance applicable to witness and hold points.

In the case of non-modification jobs such as Maintenance Predefines, and other rehabilitation jobs, inspection and test plans referenced in the work package or the task instructions identified in the Work Order task instructions will be used.

Oversight / Surveillance elements/checks discussed in documents such as N-GUID-09701-10120, Guideline for Construction Oversight, N-GUID-01983-10004, Field Engineering Quality Control Mechanical, N-GUID-01983-10005, Field Engineering Quality Control Electrical and Control, N-INS-01983.1-100014 Field Engineering Material Control during Installation, and N-INS-09701-10007, Project Oversight Planning & Implementation will be used as appropriate to the specific work execution in the field.

1.0 PURPOSE

The purpose of this Quality Plan (QP) is to address the quality requirements as they relate to the Darlington Refurbishment Program (DRP) per D-PCH-09701-10000, Darlington Refurbishment Project Charter. The objective of this QP is to outline the continuous quality surveillance that will be conducted to address the quality and regulatory requirements through all of the DRP phases, provide assurance that project completion assurance is obtained and to interface with the project staff and regulator.

This QP provides a link between the Ontario Power Generation’s (OPG) Nuclear Management System and the quality systems of the contractors engaged in the DRP. Figure 1 depicts the overall quality management system hierarchy as implemented in OPG.

Work performed for the DRP will be subject to additional quality surveillance to ensure requirements of the Darlington Refurbishment Program Charter (D-PCH-09701-10000) are met. See Figure 2.

The preparation, approval, issue, distribution and revision of this QP is in accordance with OPG’s Nuclear Management System. This QP, referenced OPG processes and Refurbishment procedures collectively meet the applicable requirements of CSA Standards and ISO (the International Organization for Standardization).
2.0 REQUIREMENTS

2.1 Background

OPG senior management, with approval by the OPG Board of Directors and Shareholders tasked Nuclear Refurbishment with assessing the feasibility of refurbishing Darlington Nuclear Generating Station (DNGS) to enable operation for an additional 25 to 30 years.

Based on the conclusion that the refurbishment of DNGS is feasible and makes good business sense, OPG established contracts with a number of Contractors. Contracted activities include:

- Engineering (design and maintenance)
- Procurement
- Construction

OPG will also perform the above activities and conduct all required commissioning and return to service activities associated with the DRP.

2.2 Objectives

The objectives of the DRP are:

i. Refurbish the Darlington Nuclear Generation Station to extend its operational life 25 to 30 years.

ii. Complete preparations for the Refurbishment planned outages as follows:

   - Unit 2 - October 2016
   - Unit 3 - October 2019
   - Unit 1 - March 2021
   - Unit 4 – October 2022

iii. Complete all Refurbishment Outages within the planned period with appropriate consideration to all aspects of the management of the facility including health, safety, environment, security, economics, quality and regulatory compliance.

iv. Complete the DRP within the planned budget as approved by the OPG Board of Directors.
v. Complete all Refurbishment Outages with zero lost time accidents or restricted work injuries.

DRP requirements are:

i. Refurbishment activities will be conducted in accordance with applicable federal, provincial and OPG requirements.

ii. All refurbishment deliverables shall meet applicable Canadian Nuclear Safety Commission (CNSC) licensing requirements.

iii. Environmental releases will be minimized and acceptable under all normal, abnormal and accident conditions in accordance with approved requirements.

iv. Personnel exposures will be As Low as Reasonably Achievable (ALARA) through all phases (i.e., design, construction, commissioning, available for service and unit readiness) in accordance with Radiation Protection requirements.

v. An integrated project schedule will be developed and maintained through the entire life of the DRP to ensure project design, verification, licensing, purchasing, fabrication, installation, construction, testing, commissioning and turnover activities are completed as scheduled.

vi. The QP will be implemented to ensure all elements of the overall DRP are carried out as required and additional surveillance is conducted on the Refurbishment work.

2.3 Policy

To ensure refurbishment is completed in a safe, timely, economic sound manner and to the required quality expectations, the DRP implements the Darlington Refurbishment Program Charter (D-PCH-09701-10000) to perform work in accordance with the managed systems defined in:

- OPG-POL-0033, OPG Business Model,
- N-POL-0001, Nuclear Safety Policy,
- N-CHAR-AS-0002, Nuclear Management System.

All DRP project work will be conducted under the authority of OPG consistent with the licensing basis and in accordance with the OPG Nuclear Management System.

2.4 Licence Requirements

Per the Darlington Nuclear Generating Station Nuclear Power Reactor Operating Licence (PROL), the licensee is required to implement and maintain a management
system in accordance with Canadian Standards Association (CSA) Standard N286, Management System Requirements for Nuclear Facilities. Figure 3 provides an overview of the regulatory requirements, project governance, and project executable processes.

For each Licence Condition (LC) in the PROL, the Licence Conditions Handbook (LCH) provides mandatory compliance verification criteria that the licensee must follow to meet the conditions in the licence, operational limits and information regarding delegation of authority and applicable version of documents referenced in the licence.

N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix provides a mapping of OPG Nuclear (OPGN) governance to CSA N286-05 to demonstrate the quality program compliance.

2.5 Organization

2.5.1 Project Organization

The Darlington Refurbishment Project Organization structure is described in the DRP Charter (D-PCH-09701-10000).

2.5.2 Project Quality Management Organization

The Project Quality Management Organization is depicted in Figure 4. This group will perform the following:

- Develop, maintain and implement a DRP Quality Plan that ensures the quality and management system requirements for the DRP are executed and completed.

- Establish and execute a project Quality Management Organization that:
  
  a. Monitors, observes and performs continuous quality surveillance on each phase of DRP as a matrixed organization.

  b. Provides assurance through the continuous quality surveillance activities that Project Completion Assurance is obtained.

  c. Can escalate and implement corrective actions for critical issues.

  d. Interfaces with other DRP internal and external independent assessment activities to coordinate and optimize the required quality surveillance activities for DRP.

- Establish metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.

- Oversee management of records of changes to the units during refurbishment.
2.6 Personnel Capability

This work will be implemented by utilizing qualified OPG staff, contractors and subcontractors in accordance with N-TQD-901-00001, Nuclear Refurbishment Training and Qualification Description.

OPG has contracted a number of Engineering, Procurement and Construction Contractors for portions of the project scope. Consistent with OPG-POL-0033, OPG Business Model, all Contractors are on OPG’s Approved Supplier’s List (ASL).

2.7 Project Interfaces

The refurbishment project interfaces will occur between various organizations and contractors. The project shall develop a project execution plan, specific procedures, instructions, and guides, etc. to control the interfaces.

Interfaces will occur between:

- Refurbishment Project Team
- Darlington Station Organization
- OPG Nuclear Engineering
- Contractors
- Regulator (CNSC, TSSA, MOE, MOL etc.)
- Other utilities (Bruce Power, New Brunswick Power, etc.)

In accordance with the Contract Agreement, interface requirements between OPG and the Contractor are outlined in the Contractor Owner Interface Requirements (COIR). The following lists the key COIR documents associated with the DRP:

- N-COIR-00120-0001, Contractor Owner Interface Requirements for Nuclear
- NK38-DAI-09701-10008, Retube Feeder Replacement Project Contractor Owner Interface Requirements
- N-DAI-00150-10000 (Draft), Contractor/Owner Interface Requirements for Nuclear

Any deviations to the interface agreement will be processed in accordance with OPG Nuclear Management System.

Table 1 outlines the contractors supplying services related to the DRP.

1 This document was issued for bid purposes only.
2.8 Documentation and Data Control

2.8.1 Records and Documentation Control

OPG’s process for management of nuclear records and documents throughout their life cycle is addressed in N-PROG-AS-0006, Records and Document Control.

The intention is to use existing OPG processes as required. Quality Records prepared by the Contractor will be provided to OPG in accordance with the Contract Agreement. Vendor technical documents will be processed according to N-PROC-MP-0078, Specification Review, Acceptance and Use of Vendor Technical Documents.

2.8.2 Information Management

The OPG process for management of OPG’s information is addressed in OPG-PROG-0001, Information Management.

2.9 Business Planning

OPG-POL-0033, OPG Business Model defines how OPG operates its business. The business planning framework to ensure compliance with OPG Nuclear Management System is identified in N-PROG-AS-0005, Business Planning. This program ensures organization alignment and defines desired results in sufficient detail to support accountability, and ensures constrains, the availability of resources, and business risks are adequately addressed.

2.10 Communication

Communication of this plan will be implemented in accordance with the Darlington Refurbishment Program Charter (D-PCH-09701-10000).

2.11 Design and Development

The framework for assurance that design and procedure changes are consistent with the plant design and licensing bases is outlined in N-PROG-MP-0009, Design Management.

The process for plant modification from the engineering change request through installation, commissioning and closeout is defined in N-PROG-MP-0001, Engineering Change Control.

The Contractor will conduct design, modification, installation, support commissioning and closeout activities in accordance with the contract agreement.
2.12 Materials Management (including identification and traceability)

For material procured by OPG to meet the DRP scope requirements, the general identification and traceability control is provided in OPG-PROG-0009, Items and Services Management.

For materials procured by the Contractor, the requirements for material identification, shipping and traceability are in accordance with the Contract Agreement.

2.13 Corrective Action

The process to ensure that deficiencies, nonconformance, weakness with a process, document or service or conditions that adversely impact, or may adversely impact plant operation, personnel, Nuclear safety, the environment or equipment and component reliability are promptly identified and corrected is addressed in N-PROG-RA-0003, Corrective Action.

This program also provides the process to ensure in-house and external Operating Experience (OPEX) evaluation and assessment including actions to improve plant safety and reliability. Effective self-assessment and benchmarking process are also implemented by this program to promote continuous performance improvement.

Contractors will manage corrective actions in accordance with the Contractor Agreement.

2.14 Monitoring and Measurement

Work plans generated from Contractors and OPG, testing requirements, regulatory interface etc. are monitored with sufficient verification and validation to meet project requirements as outlined in this plan (see Section 2.14 for additional details).

2.15 Independent Assessments

N-PROG-RA-0010, Independent Assessments provides the processes for performing comprehensive and critical evaluation of all activities affecting Nuclear facilities (i.e., independent assessments performed by Nuclear Oversight and Nuclear Safety Review Board). The Program is owned and implemented on behalf of the Chief Nuclear Officer (CNO) by the Assurance Organization under OPG Business Model, OPG-POL-0033.

External assessments are also performed by groups outside of OPG such as WANO, CNSC, Ministry of Labour (MOL), Ministry of Environment (MOE) etc.

2.16 Quality Surveillance

The Project Quality Management Organization will conduct continuous quality surveillance activities on the Refurbishment projects during the following phases (See Figure 5):
DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN

1. Shutdown/Layup
2. Design
3. Procurement
4. Construction
5. Commissioning
6. Available for Service
7. Unit Readiness
8. Closeout

An implementing document will be prepared to outline the details associated with the above surveillance activities.
3.0 ROLES AND ACCOUNTABILITIES

This QP identifies the Director, Quality Manager’s role and responsibilities. Further details of project team roles and responsibilities are contained in approved role documents, project execution plan and other project documents.

Contractors will manage responsibilities in accordance with their contract agreement.

3.1 Director, Quality Management

- Responsible for ensuring the quality and management system requirements for the DRP are executed and completed.
- Responsible for ensuring continuous quality surveillance is performed during each phase of DRP.
- Responsible for providing assurance through the quality surveillance activities that Project Completion Assurance is obtained.
- Can escalate and implement corrective actions for critical issues.
- Responsible for the interfaces with other DRP internal and external assessment activities to coordinate and optimize the required quality surveillance activities for DRP.
- Responsible for establishing metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- Can direct specific quality surveillance activities to prevent incidences based on risk and OPEX.
- Oversee management of records of changes to the units during refurbishment.

| R002         | • Incorporation deviation list previously agreed to in September 2013;  
|              |   o Item 3.25: Reference updated  
|              |   o Item 4.11: Contractor’s procurement activities to be in accordance with the EPC agreement. Where sub-contractors are not on OPG ASL, the Contractor shall follow the agreements submittal process. Appendix E added to clarify.  
|              | • Updates since September 2013  
|              | • General:  
|              |   o replaced 'PassPort' with 'Asset Suite'  
|              |   o replaced 'SDH' with 'VenDM'  
|              |   o replaced 'OPG Project Representative' with 'OPG'  
|              |   o replaced 'Contractor Project Representative' with 'Contractor'  
|              | • Section 2.1 Process:  
|              |   o Deleted text qualifying the scope of application; i.e., limiting scope to only 'nuclear related' work. Included explanation of the use of deviation list.  
|              |   o Removed engineering and procurement gap analysis reference.  
|              | • Section 2.2; added "and Project Quality Assurance Plan"  
|              | • Section 2.2.1:  
|              |   o Text updated to align COIR with OPG/JV RFR project agreement.  
|              |   o Clarified applicability of Category 1 tooling.  
|              |   o Included reference to N-PROC-MP-0105  
|              |   o OPG Enterprise Asset Management – Asset Suite 7  
|              |   o Identified N-GUID-08133-10072 as a new reference  
|              | • Section 2.2.2: revised wording with respect to PEO Act and removed reference to Bounded Set.  
|              | • Section 2.3 OPG Roles and Accountabilities  
|              |   o Item (e) removed; "OPG shall be involved in developing Commissioning work plans (or comprehensive work packages) for OPG approval." Accountabilities are now detailed in Section 5.  
|              | • Section 2.4: Added 'It is expected the Contractor will retrieve the latest version of OPG forms, templates and procedures etc. at the beginning of each Contractor activity.'  
|              | • Section 2.5 Deviations from the IR:  
|              |   o Identified the use of N-FORM-11070  
|              | • Engineering (Section 3) updates  
|              |   o Section 3.0: deleted 'All Category 1 tooling and' from introductory
sentence.

- Item 3.2; Removed 'Business Services (where not otherwise specified in this document as required to support OPG's QA program.
- Item 3.5 'Reports' reitemized as 3.5 a). Clarified that OPG accountability includes Review in the title. Added 3.5 b) 'Certified Design Report' to distinguish the OPG and Contractor references to be used for each.
- Item 3.9; added N-FORM-11524 as reference and deliverable.
- Item 3.13; deleted 'or equivalent' from deliverable.
- Item 3.17; updated to reflect OPG is accountable for Master EC preparation. Contractor to support as required. Added N-GUID-08133-10072.
- Item 3.28, 3.37, 3.39, 3.72, 3.76, 3.77, 3.88; Clarified use of N-GUID-08133-10072.
- Item 3.19; clarified OPG to support as required.
- Item 3.20: 'Modification Design Requirements': Title changed to Package Design Requirements. Accountabilities updated; Modification Design Requirements are to be prepared by OPG. Package Design requirements are to be developed by the Contractor. Contractor references added.
- Item 3.21; Cross reference corrected to 3.87.
- Item 3.23; Changed 'Field Verifies' to 'Verifies' in Contractor Accountability. Contractor references updated.
- Item 3.25: Changed reference from 2206-07-20-TF0001 to TF0038.
- Item 3.27: specified that Issue Tracking File deliverable will be included in Section 4 of the Design Plan and that a copy will reside in the working files folder.
- Item 3.32: Item titled changed from 'Design Manuals - New' to 'Design Manuals'.
- Item 3.37: OPG APPROVE Accountability removed. Provided clarity on support role.
- Item 3.39: Replaced 'N-INS-03561-10007' with 'N-GUID-03651-10002'
- Item 3.44; added NK38-GUID-50000-10001 reference
- Item 3.46; clarified OPG accountability is ACCEPT
- Item 3.47; added 2206-07-WI-0003 reference and HF Engineering Program Plan and HF work sheets as deliverables.
- Item 3.51; editorial – ACCEPT added to title to reflect existing text.
- Item 3.52: added NK38-GUID-01900-10001, Darlington Refurbishment: Design Completion Assurance to references
- Item 3.54; reference N-GUID-01900-10001 replaced with NK38-GUID-01900-10001.Verification 'Report' deliverable changed to Verification 'Package'
- Item 3.58: changed reference 'N-PROC-MA-0095' to 'N-INS-
08125-10001’
  o Item 3.64: editorial – ACCEPT added to title to reflect existing
text. Cross reference to items 3.66 and 3.67 corrected to 3.65 and 3.66
  o Item 3.65; changed reference list to include Contractor references
  only. Deleted 'per an OPG approved process for controlling
  change' from Contractor Accountability.
  o Item 3.70; added Derived Requirements to contractor
  accountability.
  o Item 3.71; added Requirements to identify item 3.72

• Procurement (Section 4) updates
  o Item 4.3: Reference to '3.78' corrected to '3.77'.
  o Item 4.7: Clarified Procurement Evaluation is for Maintenance
  Spare Parts and added N-PROC-MP-0098.
  o Item 4.13: removed text 'if disposition suggests use as is or
  requires repair/ rework'. Contractor reference updated.
  o Item 4.14 a) retitled as 'Non Conformances (Not applicable to
  o Item 4.14 b) retitled as 'Non Conformances (Applicable to OSM)'
  and added accountabilities. Previous item listed as 4.14 b), 'Non­
  conformance post execution' reitemized as 4.14 c)

• Construction (Section 5) updates
  o Items 5.1; added Reference. Specified that deliverable is a
  Construction Quality Assurance Plan.
  o Item 5.2; separated into a) Safety Program and b) Environmental
  Program. No change in accountabilities.
  o Item 5.4 'Control of Field Changes'; clarified work to be performed
  under a) ECC - OPG governance and work to be performed
  under b) Non ECC - Contractor governance. Accountabilities for
  non ECC changes clarified.
  o Item 5.5: Contractor References Added. Removed OPG
  accountability to approve the schedule.
  o Item 5.6: clarified 'Work Order Assessing/Planning' to be
  performed under a) OPG governance and b) Contractor
  governance.
  o Item 5.7: retitled 'Work Plans'; clarified work to be performed
  under OPG governance. Update OPG references.
  o Item 5.8: retitled 'Preparation of Comprehensive Work Package'.
  Preparation and content clarified in 5.8 a) thru 5.8 j). Contractor
  references added.
  o Item 5.9: specified readiness/challenge meeting and work release
  to be performed under a) OPG governance and b) Contractor
  governance.
  o Item 5.10: specified permitry planning for a) OPG equipment and
  b) Contractor Tools and Equipment.
  o Item 5.11: specified permitry execution for a) OPG equipment
  and b) Contractor Tools and Equipment
  o Item 5.12; clarifies OPG is the approving authority. Updated
Title:
RETUBE FEEDER REPLACEMENT PROJECT
CONTRACTOR/OWNER INTERFACE REQUIREMENTS

references and deliverables.

- Item 5.13: specified Calibration for a) permanent station equipment and b) Contractor Equipment. Replaced reference 'N-INS-01516-10009' to 'N-INS-09100-10012'.
- Item 5.13 a) Changed reference 'N-INS-01983.1-10012' to 'N-MAN-01983-10000'.
- Item 5.13 a) OPG accountability changed from Support to Review and Accept.
- Item 5.14: title changed from 'Construction Completion Certificate' to 'Construction Completion Declaration (Return to Service)'. OPG References replaced with Contractor References.
- Item 5.15: retitled 'Contract Construction Completion'; updated to reflect contract requirements
- Item 5.16: Added N-GUID-09701-10020
- Item 5.17: modified to reference Item 3.69
- Item 5.18: modified to reference Item 3.70
- Item 5.20 'Plant Status Control'; New. Added to reflect OPG governance.

- Appendix A updates
  - Replaced 'N-INS-01516-10009' with 'N-INS-09100-10012' which superseded it. It was a duplication of work reporting requirements for M&TE.
  - Removed reference to N-INS-08132-10000 as it has been obsoleted as this legacy document under N-PROG-MP-0001 was rarely used.
  - Removed reference to FIN-MAN-CM-001 as it has been obsoleted as each BU developed governance for management of contractors which replaces OPG wide FIN-MAN documents.
  - Replaced 'N-INS-01983.1-10012' with 'N-MAN-01983-10000' which superseded it. The governing document framework specified in N-PROG-AS-0007 has been changed.
  - Replaced 'N-PROC-AS-0069' with 'N-MAN-01983-10000' which superseded it. The governing document framework specified in N-PROG-AS-0007 has been changed.
  - Reference 'N-GUID-08130-10008' removed as it has been replaced by the Assessing On-Line Guide.

1.0 INTRODUCTION

1.1 Scope

This Interface Requirements (IR) outlines the specific responsibilities and interfaces between OPG and the SNC Lavalin-Aecon Joint Venture ("the Contractor") while performing activities in support of the Retube Feeder Replacement (RFR) Project for the Darlington Refurbishment.

1.2 Purpose

The purpose of the IR is to facilitate the successful implementation of the RFR Project by ensuring that Engineering, Procurement, and Construction activities are in conformance with OPG and other regulatory requirements.

1.3 Safety

Safety is the paramount priority when conducting any business activity in OPG Nuclear. Safety includes Nuclear, Conventional, Environmental, and Radiological safety aspects. Our business needs to comply with all applicable Federal and Provincial regulatory requirements.

2.0 DESCRIPTION

2.1 Process

This IR is to be used for any work conducted under the RFR project.

Specific work packages including modifications, replacement and repair activities may be required to use only some portions of this document. These will be documented in a deviation list (see section 2.5), signed by OPG and the contractor. Contractor steps may not apply to all work and are illustrative to support the OPG/Contractor Interface Requirements. The items in this IR are intended to outline the interface with OPG and the Contractor, and may or may not be sequential or reflective of business processes within OPG.

A gap analysis (NK38-REP-09701-10121) was completed to determine what processes and procedures under the Contractor's quality assurance program were deemed equivalent to OPG standards and requirements. Those processes and procedures acceptable to OPG are cited in Sections 3 and 4. A summary of both OPG and SLN-A governance has been provided in section Appendix A. Sections 3 to 5 of this document details typical deliverables or items related to projects where there is an OPG/Contractor interface in the delivery of work.

2.2 Contractor Responsibilities

The Contractor shall have and maintain full working knowledge of OPG's Design and Configuration Management standards and procedures to ensure that design basis and plant configuration management standards are maintained throughout the project life cycle.

The Contractor has responsibility for maintaining accuracy of technical content and compliance with the Contractor's Quality Assurance Program and Project Quality Assurance Plan.
2.2.1 Governing Procedures

All design packages will be performed in accordance with the Contractor's Quality Assurance Program, the Scope of Work which includes OPG Specification for each project, and any related Engineering Plans as defined in this IR.

All modifications will follow OPG Risk Based Modification Process N-PROC-MP-0090, with the exception of Category 1, 2, 3 and 4 Tooling engineering and Mock-ups engineering. With respect to procurement activities, in case of conflict, the provisions in Exhibit 2.11-Procurement Work, shall take precedence over the interface requirements set out in this document.

Category 1 Tooling tie-ins to the station follow N-PROC-MP-0090.

Category 1, 2 and 3 Tooling follows N-PROC-MP-0105.

Category 1, 2, 3 and 4 Tooling will follow Tooling Quality Design Plan NK38-DP-31110-10001 and are not subject to these interface requirements.

Mock-ups engineering will follow the Contractor's Quality Assurance Program and Project Quality Assurance Plan (SLN 509407-000-00D00-38QP-0001).

Tooling design will follow the requirements set out in section 4.6 of NK38-DR-31110-10000 (Contract Exhibit 1.1 (hhhhhhh) - Tooling Design Requirements).

Mock-up design will follow the requirements in Darlington Energy Complex (DEC) Mockup Scope of Work (Schedule 1.1 (00) - Mock-Ups Scope of Work within Contract Exhibit 1.1 (wwwww) - Mock-Ups Contract).

The Preparer, Verifier, and Approver of the Design Packages must be qualified to the Contractor's quality assurance program.

**OPG Enterprise Asset Management - Asset Suite 7 (Formerly PassPort)**

Asset Suite will remain as a repository for EC changes and to control modification packages as per the CNE Directive.

Population of Asset Suite will not be sequential with modification progression. Rather only relevant Asset Suite panels will be populated as needed to progress work and maintain configuration management (per N-GUID-08133-10072). The Contractor will be required to populate the relevant Asset Suite panels at the end of the following modification phases:

(a) At the start of **Scoping** to register Master ECs.

(b) At the end of **Modification Planning** to populate Master ECs, register Design ECs and flag the Associated Document List (ADL)/Associated Equipment List (AEL).

(c) At the end of **Design Completion** and prior to **Available for Service** to incorporate all field, and non-intent changes.

(d) Prior to **Closeout** to launch the AEL, and populate closeout related panels.

A scanned version of the approved Master EC Binder and/or Design Package shall be uploaded to VenDM. When the opportunity arises to populate Asset Suite, the EC packages shall be attached to the RDL of the relevant Master or Design EC.

Approval of the EC resides with the scanned copies of the packages in VenDM or Asset Suite.
2.2.2 Professional Engineers of Ontario (PEO)

The Contractor shall comply with the Professional Engineers Act, R.S.O. 1990 and any applicable regulations and guidelines.

2.3 OPG Roles and Accountabilities

OPG shall appoint single points of contact for project related work utilizing this document.

**NOTE:** OPG does not accept accountability for the accuracy of technical content of any document produced by the Contractor, including verifications of any assumptions regarding existing condition of the equipment/system interfacing with the new modification.

OPG roles / accountabilities as defined in sections 3 to 5 of this document are defined as follows:

(1) Review

Review means that when stated in the Design Plan or in the approved IR document or in the agreement between OPG and Contractors, a signed copy of the specific Engineering Document will be transmitted to OPG for comments, and an acknowledgment of receipt is to be recorded by the Contractor.

An OPG review is to ensure that the deliverable satisfies the project scope & design requirements, and procedural compliance to the specified governance within this IR. OPG reserves the right to conduct a further detailed review of the deliverable if OPG feels necessary.

(2) Accept

Accept means that the document or deliverable is suitable for its intended use, and meets process, format and content per Section 3.0, 4.0, and 5.0 as required for its input into the OPG's Enterprise Asset Management System (Asset Suite).

(3) Authorize

Means to permit or allow the use of the engineering product by others.

(4) Support

As applicable, Support means to lend the Contractor verbal and process guidance by:

- Attending and contributing at meetings.
- Participating in discussions and providing informal undocumented comments.

(5) Approve
(a) Engineering Approval is conducted by the Contractor under the Contractor's QA program. Approval of engineering design documentation may require a Professional Engineer's (P. Eng) signature and seal. Such approval means taking professional design responsibility for the engineering document. P. Eng. Signature requirements are specified in N-LIST-01300-10000, Bounded Document Set.

(b) OPG or Design Authority (DA) approval shall be performed by OPG to signify OPG's acceptance that the product(s) is prepared, reviewed, and verified by competent persons and that appropriate processes/procedures including codes and standards were applied. In addition, the approval shall ensure that the document or deliverable is suitable for its intended use, and meets process, format and content requirements as required for its input into the OPG Records Management system.

(c) Director of Operations & Maintenance (DOM) approval signifies the deliverable has no significant impact on Plant Operations and License obligations (e.g., Safety, Environmental, Production etc.).

(d) OPG shall be actively involved and have ownership of the development of the Modification Design Requirements and Commissioning Specifications for OPG approval.

2.4 Forms and Template Revisions

It is expected the Contractor will retrieve the latest version of OPG forms, templates and procedures etc. at the beginning of each Contractor activity.

If a revision to an EC or document is required, the forms and templates originally used in preparation of the initial EC or initial document shall not need to be updated to the most current form or template revision unless required to do so by the Design Authority.

2.5 Deviations from the IR

Deviations from this IR will be documented via N-FORM-11070, the Scope of Work or Applicable Master EC Package.
2.6 Abbreviations and Acronyms

ADL - Affected Document List
AEL - Affected Equipment List
AFS - Available for Service
ANI - Authorized Nuclear Inspector
ANIA - Authorized Nuclear Inspection Agency
BOM - Bill of Materials (Spare Parts for Equipment)
CCD - Computer & Control Design Specialist
CD - Control Document
CNSC - Canadian Nuclear Safety Commission
COMS - Constructability, Operability, Maintainability and Safety
DA - Design Authority, Darlington Nuclear of Darlington Refurbishment
DBOM - Drawing Bill of Materials
DE - Design Engineer
DO - Drawing Office
DOM - Director of Operations and Maintenance
DP - Design Plan
DLA - Designated Licensing Authority
DR - Design Requirements
EBOM - Equipment Bill of Materials (Spare Parts)
EC - Engineering Change
EQ - Environmental Qualification
FIC - Field Initiated Change
HFE - Human Factor Engineering Specialist
JHSC - Joint Health and Safety Committee
LOTO - Lock Out Tag Out
MDR - Modification Design Requirements
MEL - Master Equipment List
MO - Modification Outline
MR - Material Request
OHSA - Occupational Health and Safety Act
OLW - On-Line Wiring
P. Eng - Professional Engineer (Licensed in Ontario)
PMID - Preventative Maintenance ID
PSR - Pre-Start Health and Safety Review
QA - Quality Assurance
RFP / Q - Request for Proposal / Quote

### RECEIVING AND INSPECTION

4.16 Receipt and Inspection Transfer for Spare Parts

- N-PROC-MM-0021, Receiving QC Inspection
- 2206-06-40-OP-0002
- 2206-01-30-OP-0009
- 2206-01-30-CF-0010

**SUPPORT/ACCEPT**
- OPG to accept parts into inventory.
- Refer to item 3.40.

**ACCOUNTABLE**
- Establish a process for the transfer of spares from the Contractor to OPG.
- Contractor receiving documents shall accompany the materials transferred to OPG stock.
- Refer to item 3.40.

### MATERIALS MANAGEMENT

4.17 Materials Management

- (Storage, Logistics, Security Screening, Warehousing etc.)
- Refer to Item 4.1

### DOCUMENTATION CONTROL AND RECORDS MANAGEMENT

4.18 History Docket

- N-PROC-MM-0021, N-FORM-10396, N-TS-08173-10001

**REVIEW / ACCEPT**
- OPG to accept History Docket as a permanent record.

**ACCOUNTABLE**
- Contractor is accountable to prepare and verify the History docket for Owner or Contractor Specified Materials and Goods purchased and received.

### APPENDIX B: PROCUREMENT ASSET SUITE TEMPLATE

In addition to the following table, Contractor is to prepare/approve and submit to OPG details of evaluation of Cat Ids. These details may include but not limited to "PE Request Log Disposition" (Asset Suite Panel Q102), "PE Safety Basis Summary" (Asset Suite Panel Q120), "PE Item Equivalency Evaluation and Configuration" (Asset Suite Panel Q150). Copies of templates for these panels will be provided by OPG.

The Procurement Plan shall be prepared and include the Owner or Contractor Specified Materials and Services procurement activities. The Procurement Plan shall be based upon the Contractor's qualified procurement program.

The plan may include, but not limited to, the following elements:

1. Executive Summary
2. Background Information
3. General Description of Product/Services
4. Technical and Regulatory Requirements
5. Historical and Future OPG Usage
6. Vendor/Marketplace Capabilities & Supply Restrictions
7. Existing OPG/Vendor Relationships
8. Bidder Prequalification
9. Competitive Tendering
10. Evaluation/Negotiation & Contract Award
11. Subcontract Management
12. Scheduling
13. Staffing and Succession Plans
14. Source Surveillance
15. Concessions and Exceptions
16. Sourcing Strategy
17. Success Criteria

25. Site Receipt of Goods, Warehousing
26. Claims Resolution
27. Invoice Approval
28. Contract Closeout
29. Post Contract Considerations
30. References
APPENDIX D: NON-CONFORMANCE POST-INSTALLATION REPORTING

The Contractor shall submit a notification on company letterhead endorsed by Senior Quality Management addressing the following as a minimum:

(a) A clear description of the defect or non-conformance.

(b) An assessment on the impact of the defect or non-conformance to the product form, fit or function. Also address the potential impact on safety if known.

(c) Identify OPG CatID numbers(s) that are affected including OPG PO and line item numbers, ship date, quantity, manufacturer product identification / traceability (i.e. serial number, lot number, batch number, manufacturing date, etc.).

(d) Immediate short term actions to be taken to remedy the situation at OPG (address the availability of replacement item(s) and delivery time lines).

(e) Long term corrective action plan to address the root cause for the defect or non-conformance, including completion / implementation commitments.

Contractor to submit notification by email to: scgs.suppliers@opg.com
APPENDIX E: OPG APPROVED SUPPLIER LIST

(a) Use of OPG's ASL.

Subject to the other requirements of the Agreement, the Contractor will be able to utilize vendors on OPG's Approved Supplier List (ASL). All vendors which are active on OPG's ASL are maintained up to date and their qualification is current. OPG's ASL is maintained using OPG's QA Program.

OPG will provide to the Contractor a list of vendors qualified on OPG's ASL periodically or as requested by the Contractor. The list will contain the following information: the Asset Suite Vendor Code, Vendor name, supplier web page - when available, Quality level (QL1 or QL3), qualification result (SAT or UNSAT), detailed scope of qualification, including scope restrictions, if the vendor has Corrective Actions issued or restrictions and warnings, if the vendor has Corrective Actions issued or restrictions and warnings (only Yes or No - no additional details), qualification effective date and expiry date, scope of supply - manufacturer, services, distributor, etc, Pressure Boundary (PB), non-PB flag, and quality standard used. The Contractor may use the list for the sole purpose of work to be performed for OPG.

Vendors on OPG's ASL may be used by the Contractor only if the Contractor determines that the information provided is sufficient and meets the requirements of the applicable standards and the Contractor's own quality program. The Contractor is responsible to use the vendors on OPG's ASL only for the specific purpose(s) for which they have been approved on OPG's ASL. The Contractor is solely responsible for taking all necessary actions to ensure that its sub-suppliers have the technical and quality assurance capability for the scope of work they are utilized for, and the ability to provide the required product or service. This includes obtaining assurance that the sub-suppliers have an appropriate and effective quality program implemented in accordance with the Contractor's own quality program and applicable standards requirements.

The use of vendors on OPG's ASL does not preclude or limit in any way the Contractor's responsibility for and obligation to provide OPG with quality parts and services meeting all requirements under the Agreement.

(b) Use of sub-contractors not on OPG ASL

If the Contractor's requirement is not satisfied by vendors on the OPG's ASL, or the scope of qualification for a vendor on OPG's ASL needs to be changed, the Contractor shall submit to OPG notification to use a new sub-contractor when required as identified below:

(i) A submittal to OPG is required for the use of sub-Contractors only when:

The contractor acts a procurement organization as per CSA N286-05 for the purchase of items and services:

- For QL1 and QL3 items only when a quality program is specified
- For QL1 and QL3 items, when the specified quality program is for CSA Z299.3 or higher (e.g. CSA Z299.1/2/3, NCA 3800 Material Organizations)
Internal Use Only

Document Number: NK38-DAI-09701-10008
Revision: R002
Page 62 of 62

Contractor/Owner Interface Agreement

RETUBE FEEDER REPLACEMENT PROJECT
CONTRACTOR/OWNER INTERFACE REQUIREMENTS

- When a primary CSA N286-05 engineering, procurement or construction is subcontracted in its entirety

(ii) A submittal to OPG is not required for sub-contractors:

- When the contractor purchase materials/ components following a CSA Z299 program as part of their manufacturing process (i.e. the contractor is the manufacturer or the manufacturer of record)
- When there is no quality program specified
- When the specified quality program is CSA Z299.4 or ISO 9001
- Service suppliers (other than those primary N286-05 engineering, procurement, or construction service suppliers identified above in (i))
- Software suppliers
- Related to the Mock-up Scope of Work
- Tooling Suppliers

The Contractor shall evaluate, audit as appropriate, and approve the new supplier, according to the Contractor’s own quality program. When a submittal to use a supplier is required, the Contractor shall provide the audit report, checklist, corrective action requests and certificates to OPG. The Contractor should assist OPG in providing business justification as to why OPG should accept using these potential Sub-Contractors.

When a submittal is not required, the Contractor shall maintain the audit report and checklists according to their own quality program requirements and provide it to OPG upon request.

| R000            | 2014-01-31 | This document supersedes NK38-PLAN-09701-10067 Sheet 0002. The changes between NK38-PLAN-09701-10067 Sheet 0002 and this document are as follows:  
  - The document number has been changed to meet the requirements of NK38-NR-MAN-09701-10001,  
  - The security classification has been removed so that the document can be submitted to the CNSC, and  
  - References have been updated. |
1.0 PURPOSE

The Planning and Controls Program Management Plan provides a strategic overview of the various processes and project management activities within the Planning and Controls organization. These processes, in compliance with N-STD-AS-0028 Project Management Standard, are applicable to all projects funded by the Darlington Refurbishment Program (DRP).

2.0 PROGRAM REQUIREMENTS

The Project Planning and Controls Department is an integral part in preparations for the refurbishment program by establishing a solid project management and controls environment to build and support the organization. P&C established, and continues today, following industry best standards for project management to ensure that the latest strategies for effective project management are utilized.

2.1 Scope

Defining project scope is a critical step to project success as it establishes the basis for project cost, schedule, risk management, contracts, and decisions. Improved scope detail leads to improved estimate and schedule accuracy. As part of the front end planning of the Darlington Refurbishment program, the program will undergo an evolution of scope development. Scope will be presented at a fairly high level (Major Program Level Scope) during the Preliminary Planning phase of the project. During the Detailed Planning phase, the scope will evolve into Master Engineering Changes (MEC’s), Design Engineering Changes (DEC’s) and detailed work orders (Developmental Scope). Finally, once the work is developed at the detailed level, Refurbishment Cyclical Outage work will be controlled at the Outage Unit execution level and be managed as ongoing work management.

N-MAN-00120-10001-SCOPE, Nuclear Projects Scoping Process, outlines the scope principles and requirements for Darlington Refurbishment Program (DRP). The scoping process is integrated with the project phases and gating process. The scope of work for the next project phase should be well defined compared to the scope for the balance of the project in future phases. The scoping process, particularly developing and defining the scope, is a continuous process in the project lifecycle.

2.2 Schedule

Establishing an accurate and realistic schedule is a critical planning tool for a project. The schedule is the main planning tool used to understand and communicate how a project will be executed and includes the interrelationships and dependencies among project activities and deliverables, and the status of the work. The schedule is critical to properly strategize, plan and prepare for upcoming project work, to determine
resource requirements, to understand how work is progressing and to apply corrective actions as required.

N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management, outlines scheduling management principles and requirements for DRP which are applicable to both OPG project teams within the DRP and to contractors whom are performing work for DRP. Schedules are to be developed with inputs from all stakeholders and are monitored and updated throughout the project lifecycle. Schedule detail must be developed at an appropriate level to allow the project team to communicate the plan, monitor project progress and as an input into cost performance metrics in order to make accurate forecasts and to strategize and plan for upcoming work.

DRP uses a multi level schedule structure (L0, L1, L2 and L3) and a standardized Work Breakdown Structure in accordance with best practices. The Program Milestones for Darlington Refurbishment are identified and maintained in the Program Integrated Master Schedule (PIMS). The schedule is maintained regularly and activities are tracked to a baseline. Variances are tracked, reported and mitigating and/or recovery plans developed when required. Critical path to Breaker Open and Breaker Open to Breaker Closed are identified, monitored and reviewed for potential impacts.

The Control & Coordination schedule (CCL2) is the level of detail that integrates all program work for all units and all bundles. The work packages, (the lowest level in the WBS structure) are represented in the CCL2 schedule by at least 1 activity and tied to the level 1 milestone schedule. All activities in the CCL2 schedule are logically tied according to the sequence of work. The Darlington Nuclear Refurbishment Co-Ordination & Control Schedule guide is currently under development.

Functional Schedules are prepared in accordance to the Functional Schedule guide (currently under development).

Contractors prepare schedules in accordance with N-MAN-00120-10001-SCH-09, Nuclear Projects Scheduling Requirements from EPC Contractors. Level 3 schedules are integrated and aligned to CCL2 and the PIMS. Vendors will self perform their schedule updates and maintenance with oversight from the OPG Master Scheduler.

The integrated Level 3 Schedule provides further breakdown of the work below the work package level and shows all interfaces and shared resources between contractors and OPG. All activities in the level 3 schedules are logically tied according to the sequence of work and summarized to the CCL2 activity level.

Milestones are baselined in accordance with N-MAN-00120-10001-SCH-06, Nuclear Refurbishment Milestone Definition Framework. The Milestones are grouped by tiers based on the authority to approve changes.
2.2.1 Schedule Update and Monitoring

On a regular basis according to the reporting cycle plan, all Level 3 Schedules shall be updated by the person or group who is performing the work (i.e. contractors or OPG). As a product of these updates, schedule progress at the Work Package level for all scheduled work is translated into the cost management system for the purposes of calculating earned value.

The progress data is verified and reviewed by OPG. Once reviewed, a variance analysis is produced to provide reasons for any schedule slippages and to determine necessary corrective action/recovery plans when needed. A critical path analysis is also produced using level 3 schedule details.

On a regular basis, according to the reporting cycle plan, all CCL2 schedules are updated by OPG based on contractor’s level 3 schedules and an overall program critical path is produced.

2.2.2 Schedule and Cost Integration

The Work Package is the lowest level of the WBS that integrates cost and schedule. Once the schedule updates are progressed and statused by work package, the physical percent complete, actual start, actual finish, forecast start and forecast finish is prepared and integrated into the cost system used for earned value calculation (Proliance) in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

2.2.3 Schedule Reporting

When the monthly updating cycle is complete, all schedules /layouts are posted in SharePoint and accessed by all OPG staff through the Scheduling Link. Reporting requirements will be established based on the phase of the Program and the nature of the work being performed by the vendor.

2.3 Cost Management

Cost management includes the processes required for planning, managing, recording, and controlling costs at the program and project/function levels within approved budgets.

The Program’s cost management process is defined in N-MAN-00120-10001-PC, Project Controls, with detailed guidance established below the manual level in the areas of cost management, change control, and forecasting.

Program level budgets are established via Program Releases. Funding for the current release period is allocated directly to functional groups (both DRP and Centre-led) upon release approval. Project funding is allocated from the program via the Gated Process and the Gate Review Board in accordance with N-MAN-00120-10001-GRB, Nuclear Projects Gated Process.
Estimated funding requirements for the program life cycle beyond the current release are documented as unreleased funds at the project and functional levels.

Program releases will also establish program level Contingency and Management Reserve funding. The program strategies for managing Contingency and Management Reserve are detailed in Sections 2.4 and 2.5 of this document. Release of Contingency and Management Reserve funding is controlled via the change control process as described in sections 2.3.3.

The program has established and will maintain a systematic and hierarchical Cost Breakdown Structure (CBS) that identifies all the Control Accounts used by the Program. The CBS mirrors the Program Work Breakdown Structure (WBS) and includes cost only elements not contained in the WBS (e.g. Contingency, Interest). Each Control Account contains one or more Work Packages (WP). Budgets for all work are established at the WP level and associated actual costs are collected at the WP level to support cost performance monitoring.

The program life cycle funding, budgets, forecasts and incurred costs are recorded, tracked, and managed within the Proliance cost management tool.

2.3.1 Earned Value Management

Earned Value Management methodology, as defined in N-MAN-00120-1000-SCH-07, Nuclear Refurbishment Earned Value Management is utilized as the primary architecture for cost management. Planned Value (PV) is established at the Work Package level, recorded as a dollar value in Proliance, and rigorously controlled via the Change Management practices as outlined in Section 2.3.3. Earned Value (EV) is derived via schedule progress and recorded as a dollar value in Proliance. Actual Cost (AC) is exported from the financial ledger (NFRA) to Proliance at the Work Package level.

Standard earning rules are defined for all phases of work (Engineering, Procurement and Construction) and shall be rolled out to each contractor before baselining the Level 3 schedule.

2.3.2 Estimating

Cost estimating is the process of determining the expected total cost of labour, materials, equipment, professional fees, and other resources required for the execution of a project. Detailed guidance on estimating for Darlington Refurbishment is provided in N-MAN-00120-10001-EST, Nuclear Projects Cost Estimating.

Project cost estimates for Engineer/Procure/Construct scopes of work are prepared internally to support the following processes:

- EPC contract Request for Proposal (RFP) and bid evaluation
- Program life cycle and release planning
In addition, once EPC vendor contracts are in place, internal estimating expertise is utilized to:

- Review vendor Estimate Plans
- Provide independent review and validation of vendor Class 4/3/2/1 estimates supplied to OPG as projects progress from definition through execution phases

### 2.3.3 Change Management

Change Management is the Project Management tool used to identify and record the effect of changes to the baseline and impacts on scope of work, costs, and schedules in DRP. This helps to maintain the integrity of the project baseline and manage funding requirements.

In accordance with N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management, the **Project Infrastructure Master Schedule (PIMS)** establishes the cost and performance baseline for managing DRP Projects. Manual N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management provides the principles to be followed in establishing cost and schedule change control for DRP projects as they are developed.

Cost and schedule alignment is maintained via the change control process outlined in N-MAN-00120-10001-PC-01, Nuclear Refurbishment Cost and Schedule Change Control.

Changes are rigorously identified, categorized, and recorded in the Proliance cost management tool in order to effectively maintain project and program baselines and track cost performance against approved plans and budgets.

### 2.3.4 Performance Measurement

Cost performance is measured using standard industry metrics at the program, project, and functional levels. Utilizing the Earned Value data structure, the following standard metrics are calculated from the Proliance cost management tool and reported via the Business Intelligence (BI) reporting tool:

- **Schedule Performance Index (SPI):** SPI is a measure of progress achieved compared to planned progress (EV/PV).
- **Cost Performance Index (CPI):** CPI is a measure of the value of work completed compared to actual cost incurred (EV/AC).
- **Cost Variance:** The difference between the budgeted value of work performed and the actual cost of that work. (AC - EV).
- **Budget Variance:** The difference between the budgeted value of work planned and the actual cost of work performed. (AC - PV).
Cost performance is monitored for various program periods, including life-to-date (LTD), life cycle, current gate, and annual release. Standard BI reports are produced at the program and project levels for these periods.

SPI, CPI, and variance metrics are all past-performance oriented. The program also utilizes forecasts at the program and project levels against approved life cycle estimates in order to proactively assess future success and take early corrective action where required.

2.4 Risk

N-MAN-00120-10001-RISK, Nuclear Projects Risk Management Process, provides direction on risk management; ensuring risks are identified, assessed, analyzed for risk response, and monitored to a robust and consistent standard to ensure that project objectives are achieved.

Risk management provides projects with forward-looking actions and metrics to reduce the likelihood and minimize the impact of undesirable events during the project life cycle. The goal of risk management is to remove obstacles to project success before they occur in order to minimize their consequential effect on project costs, schedule, quality, and safety targets.

Proactive risk management is used to understand the characteristics of the risk, how to manage them, and plan for contingency based on the residual risks. As such, risk management can have a significant impact on the financial health of the project.

N-MAN-00120-10001-RISK-04, Nuclear Refurbishment Risk Management, provides guidance on how to use the risk register to identify, update and close risks in the program and project risk registers. It also defines the Darlington Refurbishment risk assessment criteria and scales, risk assessment heat map and minimum risk review frequency. It sets the expectations for preparing Project Risk Management Plans (RMP) by contractors and refurbishment projects. Risks that only apply to the contractor are the responsibility of the contractor to manage. Oversight is provided by OPG to ensure an effective RMP is in place.

2.4.1 Risk Register Administration

(a) Program RADAR, the DRP program risk register, is managed by the Risk Section, P&C. It contains risks that apply to the entire DRP program and risks that are related to the DRP Functions, e.g. Planning and Control, Supply Chain, etc.

(b) Project RADAR, the DRP project risk register, is managed by each individual bundle in Project Execution. It contains risks that apply to project work within a bundle, e.g. Balance of Plant, Fuel Handling, etc.
2.4.2 Risk Reporting

(a) As part of the monthly reporting cycle, risks are reported in:

- Top Risks from each Bundle and Function in the Monthly Quad Charts
- Key DRP Program Risks

Note: For each risk being reported on quad charts or program risk reports, the following information should be communicated:

- Risk ID
- Risk Title
- Risk Description
- Risk Response Strategy and Status
- Current Risk Score
- Post-Risk Response Risk Score
- Target Completion Date of reaching Post-Risk Response Risk Score

(b) The following reports are communicated to senior management:

- Top DRP Risks reported quarterly in the Nuclear Oversight Committee (NOC) and Executive Advisory Committee (EAC) reports.
- Key Program risks are reported to ERM using the BURSA template. See OPG-PROC-0094, Enterprise Risk Management Report.
- Risks that are jointly being addressed by the Darlington Station and DRP are presented and discussed on a quarterly basis at the Darlington & Darlington Refurbishment Common Risk Challenge Meeting.

2.5 Contingency

N-MAN-00120-10001-RISK-05, Nuclear Refurbishment Contingency, Development and Management, provides direction for contingent funds development. For the purposes of contingency determination, projects utilize quantitative analysis based on their identified risks.

Contingency development is an integral part of estimating, scheduling and risk management processes. Contingent funds to address uncertainties in a project should be proportionate to the project size, duration and complexity, risk exposure and tolerance, organization’s prior experience with the work, and confidence levels set by management. At DRP, there are two main classifications of contingent funds to address different types of uncertainties – contingency and management reserve.

Contingency at DRP is further sub-divided into Project Contingency and Program Contingency to address uncertainties in project bundles and functional groups, respectively. It is not intended for changes in scope or extraordinary major social or natural events such as war, strikes, flood and earthquakes, which are addressed by Management Reserve.
2.6 OPEX

Darlington Refurbishment Operating Experience (OPEX) will be managed in accordance with OPG Nuclear N-PROC-RA-0035, Operating Experience Process. This identifies, evaluates, and takes action based on internal and external industry lessons learned in order to improve project and plant safety, reliability and performance.

In addition, N-MAN-00120-10001-RISK-06, Nuclear Refurbishment Processing Operating Experience, and Key Lesson Learned, provides guidance on the process to integrate relevant Project and Contract Management OPEX and Key Lessons Learned into the planning and execution phases of the Darlington Refurbishment program.

This will enable the NR program to use the above lessons learned information to improve project planning and execution phases, their processes, procedures, training, and system/equipment design to the fullest.

DRP OPEX SPOC creates specific communication to various stakeholders in the organization monthly and also maintains DRP OPEX events list located on the DRP SharePoint team site for all employees to use.

2.7 Documentation and Project Closure

Records, documents and data collectively form the memory of the Darlington Refurbishment Program. They constitute the business and intellectual assets of critical importance, and must be managed to meet both regulatory and business requirements.

Documents shall be managed throughout their life cycle e.g. project planning, execution and program closure in accordance with N-PROG-AS-0006, Records and Document Control.

In addition to the standards and procedures described in N-PROG-AS-0006, Nuclear Refurbishment has developed electronic document control processes in conjunction with the implementation of an Electronic Document Management System (EDMS). N-MAN-00120-10001-RDM, Nuclear Project Records and Document Management, provides the direction related to electronic management of information.

Scope ID represents the contracting strategy, identifying the relationship with the DSR line items and the scope of work to maintain integrity and traceability of the data (Project Control data structure map is in Appendix B).

2.7.1.1 Document Creation

Requirements for creating, reviewing, approving and issuing Darlington Refurbishment process support controlled documents will be documented in NK38-NR-MAN-09701-
10001, Darlington Refurbishment – Requirements for Process Support Controlled Documents (pending issuance).

Process support controlled documents are those documents which support the definition or implementation of a process (e.g. Program Management Plans, Manuals, Guides, Instructions and refurbishment-specific technical documents/procedures developed under N-PROC-AS-0028).

### 2.7.1.2 Filing and Retention of DRP Records

All records generated as a result of executing work under the DRP Program, must have a documented plan for filing and retention. It is the responsibility of the process owner to confirm the filing and retention requirements. These requirements are documented in a “Records Table” (see sample below), which must be included in the applicable process support document.

<table>
<thead>
<tr>
<th>Record Created</th>
<th>Associated Form Number</th>
<th>QA Record Y/N</th>
<th>Filing Information/Retention</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program Risk Identification Form</td>
<td>N-FORM-11306</td>
<td>N</td>
<td>File locally by department.</td>
</tr>
</tbody>
</table>

### 2.7.1.3 Submission

All Supplier documentation deliverables must be submitted electronically to OPG using EDMS. Exceptions apply when the format of the deliverable does not support electronic submission. EDMS has replaced the Supplier Document Hub, which will be phased out in early 2014.

### 2.7.1.4 Review and Acceptance or Approval

Submittals are routed electronically within EDMS for review. Reviews will be conducted by the appropriate stakeholders in accordance with the Gate Review Process described in N-MAN-00120-10001-GRB. Review comments are stored within EDMS, and returned to the submitter within contractually agreed due dates. OPG Records and Document Management (RDM) staff workflow, track, and report on processing dates.

Documents are routed electronically for acceptance or approval (with some exceptions). Once accepted, a document becomes an official project record at which time it is processed by RDM staff into an Approved Information Management System (e.g. Asset-suite).
DRP employs SharePoint team sites for collaboration and storage of OPG internal project documentation and non QA records.

2.7.1.5 Communicating OPG Requirements to Suppliers

Project Managers are accountable to prepare and issue a formal Communication Protocol document to successful Suppliers immediately after contract award. The Communication Protocol document provides direction on how project correspondence and documentation deliverables are managed, and points to the process support documents and tools that the Supplier must reference in order to be compliant.

2.8 Project Management Logs

Actions, Issues, Decisions, and Key Assumptions (AIDA) of Darlington Refurbishment will be managed in accordance with N-STD-AS-0028, Project Management Standard.

AIDA is a data base, a repository for Actions, key issues, decisions and assumptions for Darlington Refurbishment Program that will be managed throughout the project lifecycle. The purpose of documenting Actions, Issues, Decisions, and Key Assumptions is to ensure that they are relevant to Darlington Refurbishment and are widely accessible by staff and to maintain an auditable trail for review, reference and monitoring.

N-MAN-00120-10001-Risk 07, Nuclear Refurbishment Actions, Issues, Decisions and Key Assumptions Management, provides guidance on how to document, review, approve and manage Actions Issues, Decisions, and Key Assumptions (AIDA) associated with Darlington Refurbishment.

2.9 Reporting

2.9.1 Reporting Approach

Timely and effective reporting supports the successful execution of the Darlington Refurbishment Program. Specifically, reporting will support management decision processes, measure progress against established business objectives, and flag any performance gaps that require management attention.

Further guidance on cost reporting is provided in N-MAN-00120-10001-PC-13, Nuclear Refurbishment Cost Management and Reporting. The overall approach to Program reporting will be defined in a new guide for Darlington Refurbishment Metrics and Reporting Projects Controls (to be developed).

Reporting will follow the same principles for all phases of the program, though the specific metrics and reports may vary to align to the business needs of each phase.
A comprehensive, tiered metrics infrastructure has been established and will be maintained at program, project, and functional levels to measure progress in the areas of:

- Environment, Health, and Safety
- Scope
- Schedule
- Cost
- Quality

The program has established a repository within the DRP Data Warehouse for metrics and reporting data. Microsoft Business Intelligence (BI) is being used as the program report generation engine to the extent possible.

### 2.9.2 Standard Reports

A set of standard reports are produced for communicating program and project level performance to suit various stakeholder needs. Generally, these reports are differentiated by the intended audience, level of detail required, and the metrics reported. Standard reports include the following:

(a) Board Update is a high-level program status report prepared for the Ontario Power Generation (OPG) Board of Directors (BOD).

(b) Periodic program level performance reports are prepared for senior OPG management audiences (e.g., Nuclear Oversight Committee, Nuclear Executive Committee).

(c) Major Darlington Refurbishment milestones and performance targets are included in corporate, Nuclear, Nuclear Projects, and Darlington Refurbishment level Report Cards produced on a monthly basis by the corporate Finance function.

(d) Program Status Report is prepared monthly for senior Darlington Refurbishment management. This report summarizes safety, schedule, cost, and quality performance at the program level.

(e) Project and Function level Quad Charts are prepared monthly. These reports summarize safety, schedule, cost, and quality performance.

(f) Functional Reports are quad charts that highlight the status of major functional organizations supporting the program (e.g., Planning and Controls, Engineering etc).

(g) The Controllership Financial & Oversight Report is produced monthly by nuclear finance. This report is a comparison of actual and forecast costs against the approved Business Plan.
(h) Standard monthly Earned Value performance reports at all levels from the program down to Work Packages are produced by the BI reporting tool for use by line managers to support ongoing monitoring and control of work programs and projects.

(i) Joint OPG/Vendor scorecards are produced for all major refurbishment contracts. These scorecards assess performance against the terms and conditions of the contracts.

2.10 IT Tools and Applications

For a large project such as Darlington Refurbishment, maintaining and managing project data and Project Information Technology (IT) tools is very important throughout the life of the project. Critical project databases should be in Chief Information Office (CIO) supported data repositories. The purchasing and maintaining of IT tools must involve the CIO. Appendix C displays the IT tools and their interactions.

The demands, priority and business requirements for IT projects and base services and associated benefits of such services are identified by Darlington Refurbishment. For Line of Business (LOB) funded projects, DRP will approve the business case and release funds before CIO undertakes project work. For the CIO funded projects, CIO will approve the business case and release funds after obtaining concurrence of project sponsor. CIO will document the business case in both cases.

In support of Darlington Refurbishment, the CIO will:

- Prepare an annual demand plan for new projects and base service changes for incorporation into the CIO and DRP business plans.
- Develop and maintain longer term systems strategy and roadmap with collaboration and participation from all levels of Nuclear Projects.
- Execute new projects and base services within the agreed scope, schedule and cost while adhering to the established IT Standards/Strategy, IT Business Plan, IT Project Delivery Framework and OPG investment guidelines.
- Establish technology standards and select vendor and technology for specific projects. DRP will provide input into technology standards and vendor/technology selection decisions. CIO will demonstrate that its decision is the most optimal for OPG.

DRP will provide input into the service levels and quality metrics for the base services. Service levels will be jointly developed and agreed upon with regular reviews and adjustments to meet the evolving needs of business and IT.
### ROLES AND ACCOUNTABILITIES

#### 3.1 Director, Planning and Controls, DRP

Ensures that effective managed systems are in place for the planning, execution, monitoring, and reporting of scope, schedule, cost, risk, Operating Experience, Gated Process and records management.

Accountable for the provision of accurate, timely performance reports to senior OPG management and stakeholders.

Is the owner of this document and is accountable for its definition, implementation and continual improvement.

#### 3.2 Manager, Project Reporting, DRP

Establish the processes, instructions, and tools necessary to execute cost management, cost estimation, and the Gated Process.

Provide expert support to Darlington Refurbishment client groups in the execution of cost management, cost estimation, and the Gated Process.

#### 3.3 Manager Project Infrastructure, DRP

Establish the processes, instructions, and tools necessary to execute risk and contingency management and operating experience.

Provide expert support to Darlington Refurbishment client groups in the execution of risk and contingency management and operating experience.

#### 3.4 Manager Project Scheduling, DRP

Establish the processes, instructions, and tools necessary to execute schedule management.

Provide expert support to Darlington Refurbishment client groups in the execution of schedule management.

#### 3.5 DRP Directors and Managers

Prepare, monitor, and control function/project budgets and ensure costs are appropriately charged to the right budget item.

Provide inputs to scope, schedule, cost, risk, and Operating Experience systems to support effective monitoring, reporting, and control to meet program objectives.

Review performance reports and take corrective action in accordance with established thresholds and business goals.
4.0 DEFINITIONS & ACRONYMS

**Actual Costs (AC)** is the realized costs incurred for the work performed during a specified time period.

**Budget Variance (BV)** is the difference at a given point in time between the Actual Costs (AC) and Planned Value (PV) (i.e. $BV = AC – PV$).

**Cost Performance Index (CPI)** is a measure of the cost efficiency of budgeted resources expressed as the ratio of Earned Value (EV) to Actual Cost (AC).

**Cost Variance (CV)** is the difference at a given point in time between the Actual Costs (AC) and Earned Value (EV) (i.e. $CV = AC – EV$).

**Earned Value (EV)** is the measure of work performed expressed in terms of the budget authorized for that work.

**Forecast** is the project team’s estimate of the most likely outcome for a given element of the project (e.g. cost forecast, schedule forecast etc.).

**Planned Value (PV)** is the authorized budget assigned to scheduled work.

**Schedule Performance Index (SPI)** is a measure of schedule efficiency expressed as the ratio of Earned Value (EV) to Planned Value (PV).

**Work Breakdown Structure (WBS)** is the hierarchical decomposition of the work to be carried out to accomplish the objectives and create the required deliverables. It is a tool used to define and group a project’s discrete work elements (or tasks) in a way that helps organize and define the total work scope of the project.

**Work Package (WP)** is the work defined at the lowest level of the Work Breakdown Structure (WBS) for which cost and duration can be estimated and managed.

**AIDA**  Actions, Issues, Decisions, and Key Assumptions
**BI**  Business Intelligence
**BOD**  Board of Directors
**BURSA**  Business Unit Risk Self Assessment
**CBS**  Cost Breakdown Structure
**CCL2**  Control & Coordination Schedule Level 2
**CIO**  Chief Information Office
**DRP**  Darlington Refurbishment Program
**EAC**  Executive Advisory Committee
**EPC**  Engineer-Procure-Construct
**ERM**  Enterprise Risk Management
**LOB**  Line of Business
**LTD**  Life to Date
**NOC**  Nuclear Oversight Committee
**NR**  Nuclear Refurbishment
DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN

OPG Ontario Power Generation
P&C Planning and Control
PIMS Program Integrated Master Schedule
WBS Work Breakdown Structure

1.0 INTRODUCTION

RQE Contingency Development Plan, NK38-PLAN-09701-10006 was prepared and approved in Q1 2015, establishing the approach for developing the RQE contingency estimate and describing the associated contingency development principles and processes.

This report documents the activities and results of the RQE contingency development process, the validation processes undertaken and the summarized outputs of the exercise. Further, this report documents the contingency development objectives, governance, procedures, activities and tools applied, including guiding check sheets, questionnaires, tools, models, and results of a series of focused workshops that lead to defining the inputs used in the first view of the integrated RQE estimate, as provided in RQE “Total Cost Estimate Milestone Snapshot #3” milestone achieved in October 2015. The intent with respect to the RQE contingency estimate is that the final total reserves estimate (contingency + management reserves) will be subject to refinement after undergoing final executive reviews and will reside in the Master Consolidated File (MCF) and board submission materials. This MCF document will be filed for archiving purposes and shall be accessible to alongside the comprehensive RQE support documentation.

2.0 OVERVIEW & BACKGROUND

2.1 Objectives

The objective of this report is to describe the activities, actions, and challenges performed by the Risk Management organization and the broader Refurbishment organization, including Nuclear Projects Executive Team (NPET) and the Executive Leadership Team (ELT) to meet the requirements of the risk management process from qualitative and quantitative standpoint during development of RQE contingency estimate and ultimately converge on a high confidence and prudentially assessed total reserves estimate for RQE.
2.2 Background

RQE is the equivalent of the Class III estimate for the 4-unit refurbishment of Darlington Nuclear Generating Station. A robust contingency development process and modelling exercise was undertaken to ensure a high confidence risk and uncertainty based contingency value was prepared as it comprises a major component of the program estimate. The RQE Contingency Development Plan was issued with the expectations regarding the process, timeline, and input quality/requirements to achieve a robust and high confidence contingency estimate. This document was used as the basis for engagement with project/function teams for the challenge workshops.

Risk group members were tasked to follow up and enforce the implementation of the plan including the risk management manual, use of RMO, population of the contingency template, and proper risk qualification and quantification practices throughout. Overall engagement of multiple tiers of oversight groups such as; Ministry of Energy oversight (MODUS), Board of Directors oversight, Enterprise Risk Management, NPET, and NR Program/Functional directors supported the Contingency Development Plan and approved the outcome of the exercise as it related to their scope of work.

In February 2015, Palisade (proprietor of the @RISK Monte Carlo simulation engine) was retained to support a three phase approach to RQE contingency development. A senior consultant was engaged to a multi-phase on site model review and optimization effort. The objective of engagement of palisade was to ensure the model used in the development of the RQE contingency estimate exceeded industry best practice and rigor, and that the outputs of the model are validated and free from user error that may impact the end results. Palisade submitted a Phase one report that reviewed the model run for Release 4D and provided a set of optimizations that were fully incorporated to the RQE model. In June 2015, the RQE Contingency Development Plan was finalized and published and communicated as per the RQE roadmap dates, incorporating a number of process and tool refinements. Upon sufficient maturation of the base estimates for RQE for all bundles of functions, the risk management team developed contingency input templates for the project and functional teams to populate and established a series of challenge workshops to ensure reviewed and balanced inputs were included in the RQE contingency model. The input templates focused on developing 3 point estimates (optimistic, realistic, and pessimistic) for all possible variables associated with discrete risks and cost and schedule uncertainties.
RQE Contingency Model development

Palisade senior consultants were engaged to ensure robustness and use of industry best practice to the RQE Contingency development process and modeling as per the OPG RQE Contingency Model Scope of Work to Palisade (Ref AAA) and OPG NR Contingency Calculation Initial Finding (Ref BBB). Initially onsite February 2015, Palisade implemented a 3 phase model review and update to the Monte Carlo tools used for RQE contingency analysis. The phases of implementation are outlined below:

a) **Phase 1:** Initial on site review of the NR Release 4D model was completed in Feb 2015, and a report was provided to OPG for evaluation and further implementation, per OPG NR Contingency Calculation Initial Findings Report (Ref BBB). This report included a matrix of recommended optimizations to be applied to the RQE model.

b) **Phase 2:** Implementation of RQE model recommendations, including integrates schedule risk and uncertainty analysis, consideration of risk reoccurrence on multiple units, and extensive usage of 3 point estimates – Jul 2015. Refer to Detailed Palisade Agenda (Ref CCC), and Disposition of Palisade Recommendation Implementation (Ref DDD)

c) **Phase 3:** Final implementation and model run, including enhancement to a fully integrated risk model for 4 units, cost uncertainty and discrete risk contingency development and analysis for management decision making to support RQE. Throughout Phase 3 Palisade conducted periodic reviews and model adjustments through remote support – August/September 2015. Weekly Go-to meetings were set up, The FTP site for file sharing was set up, and along with the regular email correspondence with the senior consultant.

The key advancements in the RQE Contingency model in comparison to the modelling exercise used in previous releases include (not limited to):

1. Identification of unit specific risk impacts, efficiency gains, etc.
2. Maximum application of 3 point estimating including ranges of probability, burn rates, risk recurrence, etc.
3. Integration of program schedule with program risks and execution window uncertainties.
4. Robust and comprehensive reports sets (including contingency breakdown reports) to allow for clear and focused analysis of the outputs.

3.0 RQE CONTINGENCY DEVELOPMENT – IMPLEMENTATION DETAILS OF THE DEVELOPMENT PLAN

3.1 Preliminary Process Activities (Getting the Organization Ready)

All Risk Register items for the projects and functional groups were uploaded into an expanded RQE template spreadsheet, from the RMO tool and populated with the latest discrete risk and cost uncertainty information provided by projects at their Gate 3 meetings where available. The templates were placed in SharePoint and the link provided to the teams for collaboration, review and update for any deltas in the required RQE contingency development analysis data.

In parallel to the activities to obtain the detailed 3 point estimates for cost uncertainty and discrete risks from the broader NR organization, a number of other contingency input streams were pursued based on the requirements defined by the RQE contingency breakdown structure outlined in the RQE Contingency Development Plan, as follows:

a) Ryan Smith, Dennis Curley and Derek McAuley led the effort to develop the integrated assessment criteria and initial input data for schedule uncertainty aspects of the integrated model. This was subsequently reviewed by Gary Rose, Roy Brown, Mike Allen, and others to ensure appropriate schedule risks and uncertainty was being applied and that it meshed with the progression of critical program aspects, such as RFR R1 Class 2 submission.

b) July 10th, Ryan Smith requested from Risk Oversight Committee members, the NPET, and external oversight support members a listing of high impact low probability risks (aka black swans) for consideration in the model/management reserves. Feedback was received and elaborated on eventually landing not as contingency contributors but rather a management reserve considerations.

c) Ryan Smith, Lisa Ren in concert with the PMs and P&C Lead prepared contingency adequacy reviews with the Campus Plan projects to support
forecasting exercises at the end of June and worked with the P&C Lead to obtain the contingency forecasts for F&I/P/SIO projects (having largely “sunk” costs and a very dynamic execution environment required a more deterministic approach with estimates provided by P&M project directors).

d) Ryan Smith and Steve Wiacek validated the BCS defined insurance uncertainty aspects with feedback from the corporate treasury of the integrated model and ensured these were incorporated into consolidated template. 3 point estimates were obtained and integrated to the model.

These contingency templates were subjected to a rigorous screening and challenge process with a panel of SMEs. Basis for the three point estimates were challenged and actions were taken to correct or clarify the risk content. The objective for these challenge meetings with the project teams (before final submission of their risk registers and 3pt estimates) was communicating that they were in “safe zones” where the Manager of Infrastructure and Risk, and some peer SPOCs from the project team could challenge and calibrate project and functional groups on their risks, conservatism, and bias before it gets to Executive Review for the final contingency calculation.

In conjunction, the latest schedule data was pulled for a systematic and risk based review of programmatic critical path activities as described in section 3.3. This review was performed “off-line” from the workshops described in section 3.2 to ensure the right focus was given by the organization to the right contingency estimate aspects.

3.2 Cost Uncertainty and Discrete Risk – Challenge Session Workshops

As per the time line found in Appendix B of this document, NR Risk and Infrastructure set up a series of challenge and review workshops, starting with Functions and continuing with Projects to review risk based contingency items and cost uncertainty elements for an integrated assessment of overall contingency values. The RQE contingency development template, used in association with these challenge workshops, was updated with the assistance of Palisade to include the expanded and comprehensive 3 point estimate approximations required for RQE contingency calculations as defined in Section 3.0 of this document.
The checklist attached to the RQE Contingency Development Plan defined the quality review criteria which were utilized to assess the contingency development process inputs, which were distributed in advance of the workshop. These checklists were not mandatory to complete the workshop process but were provided to the teams as guidelines and expectations for what lead in considerations should be made prior to the workshops. Projects and Functions were asked to come to the workshops with any opportunities identified the same way in the table (tagged as opportunity instead of risk which of course would be the bulk majority of line items for review). There were limited opportunities identified by the project or functional teams. Most identified that all cost and schedule optimizations/opportunities were already incorporated in the development of their base estimates and as such there were none reasonably foreseen that could be further applied to the RQE contingency development process.

The 3 point estimates for cost uncertainty was to be provided by the project team by Project # and PEPCCC (Project Management-Engineering-Procurement-Construction-Commissioning-Closeout) element and not bundle. Cost estimate PEPCCC was to be considered for cost to go only, and excluded LTD costs as they are already sunk and certain to ensure an appropriate representation of forward looking for contingency could be estimated. A comment and basis column was added at the end of each table to provide rationales and explanatory details regarding 3 point analysis. In most cases this was prepared in advance of the workshop and completed/adjusted after the workshop. In preparation for each workshop, Projects and Functions were asked to ensure the following was completed prior to the meeting:

Information provided in RQE contingency development template has been;

- Reviewed by their team and relevant stakeholders to ensure the gate 3 data is correct,
- Trued up to the latest project status,
- Completed with all additional RQE delta information and rationale comments

A quality check of the of each bundle and function’s contingency information was conducted by using the following RQE Contingency Development Checklist. (REF EEE) The checklist was a guideline to try to extract the highest quality risk and uncertainty inputs prior to the workshops to avoid obvious errors or improper
inclusions. A consistent agenda (or “script”) was developed by the challenge panel and reviewed in the workshop to provide a standardized and consistent approach for executing the challenge meetings. The agenda was circulated to the project and functional managers in advance to give them a sense of the focus areas of the challenge meetings. See RQE Contingency Development Agenda (Ref HHH). RQE Contingency Development Template for Cost Uncertainty (Ref FFF) and RQE Contingency Development Template for Discrete Risk (Ref GGG).

The team leads were asked to validate their submissions with their P&C Leads and Project/Functional directors prior to the workshop meeting. The reviews were conducted with a challenge panel which attended all meetings to coach and review the templates line by line with the project teams.

RQE Risk Contingency Development Workshops included involvement from:

- Risk consultant Shoshanna Fraizinger

The Risk Management Team members

- Ryan Smith, Manager
- Lisa Ren, Section Manager
- Donna Flewell – Process Specialist
- Mirela Courtney – Process Specialist
- James Wu – Process Specialist
- Atef Soliman Cost & Schedule Analyst
- Cost Estimates inputs provided by Mirela Courtney – Process Specialist

Challenge Panel comprised of:

- Dennis Curley, Outage Manager
- Steve Wiacek, Finance Controller
RQE CONTINGENCY DEVELOPMENT REPORT

- Andy Elliott, NR PMO Manager
- Jim Carter and/or Carrie Okizaki Modus
- Norton Thomas, Enterprise Risk Management
- Other SMEs were appropriate were included.

Official RQE Contingency Development Minutes of Meeting (REF III) were taken and later distributed to assist the teams with final updates followed up on to ensure closure and incorporation to the final template submissions.

3.3 Schedule Uncertainty and Risks to Critical Path

The overall program schedule was analyzed in three major segments (driven by critical path through the integrated schedule) as represented in the Rev A outage logic. These segments were based on the following:

1. Defueling activities – as described by technically driven estimate provided by the vendor (see ref. NK38-PLAN-35000-10005), i.e. “lead in”

2. RFR activities - as described by the vendor class 2 estimate (incorporating all the refinements provided by the rev 0, rev. 0’, rev 0 proxy and ultimately rev. 1 submissions) and;

3. Refurbishment lead in/out activities – utilising the logic of best and worst case scenarios of known integration and interface, Bruce lead out activity logic, OPEX incorporation based on comparisons of other facilities (ie; Wolsong, LePreau)

Detailed forward and back pass analysis was performed and range estimates applied to estimated durations with the support of SMEs and window owners. OPG owned and JV owned schedule based discrete risks were reviewed and some were identified to have a) impact to Program critical path and/ or b) interface or integration aspects; these risk items were pulled into a vertical slice review against the major schedule segments and associated schedule uncertainty values to ensure there was no “double count” or contingency considerations being applied. Individual consultation with SMEs and outage manager continued from July through August and a workshop outlining
preliminary results and challenge was held on Tuesday August 25th with VP Execution, Director of Planning and Control, Outage Manager, Project Director for RFR, Scheduling Manager and Risk Manager. The preliminary list was adjusted to result in the final schedule risk and uncertainty analysis presented in the RQE.

Sep 23, NPET senior management review was conducted to review the overall 4 units schedule contingency. Also, it focused on items for key items for program contingency and management reserves. This 4-unit analysis was again challenged for the uncertainty and risk applications, ensuring the right range of uncertainties (with basis) and the right risks were applied (with basis) to the schedule. This underwent extremely detailed and rigorous reviews with escalating oversight, all the way up the MODUS direct involvement and NPET member direct involvement.

Burn rate details used in the risk analyses were programmatically defined and applied with the support of the finance and RQE organizations (for both the schedule uncertainty items and schedule impacting discrete risks), Burn Rate - Critical Path Contingency Calculation (REF JJJ), dated as Sep 16 email correspondence in Burn rates for NR PMT, NR construction, etc were obtained from the master consolidated file and optimistic, most likely, and pessimistic critical path burn rates were provided. The range of burn rates covered the “carrying cost” at “off peak” and “peak” period on NR critical path, which shall cover the various execution windows that the risks may occur.

3.4 Insurance Uncertainty

Insurance aspects of contingency have been contemplated in conjunction with discrete risk and cost values provided by Finance based on Program assumptions and planning basis defined by the BCS. These have been directly translated into the integrated template for overall modelling and RQE contingency calculations.

3.5 Various Review Meetings

The contingency development workshops took place as follows:

- July 13th – Project Contingency Work shop dry run with P&C leads.
- July 14th – Project Contingency Development Review Work shop –
  Turbine Generator
RQE CONTINGENCY DEVELOPMENT REPORT

- July 16th - Project Contingency Development Review Work shop – Islanding
- July 20th Project Contingency Development Review Work shop – RFR
- July 20th Project Contingency Development Review Work shop – Operations & Maintenance
- July 21st Project Contingency Development Review Work shop – Engineering
- July 22nd Project Contingency Development Review Work shop – Shutdown Layup,
- July 22nd Project Contingency Development Review Work shop – Functional Departments
- July 22nd Project Contingency Development Review Work shop – Fuel Handling /Defueling
- July 23rd Project Contingency Development Review Work shop – Steam Generator
- July 23rd Project Contingency Development Review Work shop – Balance of Plant
- July 27th Project Contingency Templates due end of day to Risk Management Team

Interface and Integration activities took place as follows:

- July 27th – TEMPLATE FREEZE – all project and functional templates for contingency will be extracted for integration i Total Cost Snapshot #1.
- Week of July 27 - Risk department performs template integration to master model and quality check (Lisa Ren), checks and balances performed on actions and queries stemming from workshops.
July 28th Risk Team completed Quality check of final templates, and uploading into Program Contingency template.

July 29th Additional Cost Uncertainly for the Bundles and functions were uploaded

July 29th NR Program level schedule Risk and uncertainly were identified

Insurance elements were incorporated in the master template

August 10-14 Palisade review template.

Interface and integration reviews utilising the Master model and template inputs from activities described in sections 3.2 – 3.7 were conducted for the first views in preparation for “snapshot #1” refinement.

Quality Review of data entered by Risk team August 17 to 21

Snapshot 1 prepared and communicated on Wednesday August 19th.

Snapshot 1 contingencies were presented the week of August 24th as part of bundle integration reviews. Adjustments to contingency input sheets were prepared by risk organization and presented in the NPET review sessions.

August 31st to September 4th Management Review

August 31st to September 4th Palisades Risk Consultant analysis of results.

Bundle Integrated Review Meeting held to review final submissions, materials reviewed included scope reports, basis and assumptions, cost estimate summaries, schedules and preliminary contingency analysis.

August 24 Bundle Integration Review – Balance of Plant

August 25 Bundle Integration Review – Islanding

August 25 Bundle Integration Review – Turbine Generator
Title: RQE CONTINGENCY DEVELOPMENT REPORT

- August 25 Bundle Integration Review – Steam Generator
- August 26 Bundle Integration Review – Fuel Handling/Defueling
- August 26 Bundle Integration Review – Specialized Projects
- August 27 Bundle Integration Review – Shutdown Layup
- August 27 Bundle Integration Review – RFR
- August 24 Bundle Integration Review – Balance of Plant (unique scope)
- August 24 Refurbishment Risk Oversight Committee (R-ROC) meeting
- September 1 – Risk Assessment of Critical Path with Director of Ops and Maintenance
- September 3rd to 9th NPEP Reviews of separate submissions by the bundles and functions
- Snapshot 2 provide September 4th
- September 4th Final Snapshot and Prep Contingency Review Workshop
- September 8th Overview of Key Risk Scores KPMG
- September 10th Integrated Contingency Estimate Review for NPET
- September 11th Input detail of Schedule Uncertainty RFR
- September 14th review of 3 point estimates with Outage Manager.
- September 15th New model walkthrough provided by Palisades.
- September 18th Final RQE alignment Meeting
- September 24th Review S Curve
NPET has conducted three review sessions on Aug 25, Sep 11, and the Total Reserves final presentation and review on October 16th. The focus of the meeting was to present the various contingency snapshots prepared in support of RQE and the major contributors of cost and schedule contingencies to allow for details drill down on key elements and executive level decision making. Modus, ERM, and Asset Planning as oversight team to OPG board of directors has conducted various review meetings on the contingency products throughout the development process.

3.6 Quality Checks

Quality Checking was done by the risk management team members by completing quality and data integrity checks after the workshops:

a) Project Teams and NR Estimating were tasked to review the impacts and uncertainty ranges.

b) Risk management team followed up on actions from review meeting, confirm completion of actions, by reviewing the meeting minutes in detail by Risk log # to ensure the advice provided from the workshop panel was considered. The changes were implemented and reflected in the final submitted data for input into the Palisade @ Risk software.

c) Risk management team conducted data integrity check to ensure data entry errors were captured upon imputing of the three point estimates into the @Risk software and reviewed with the project teams as required. Inherent to the model, a built in quality check identifies if there are any three point estimates where the optimistic impact exceeds the most likely, pessimistic is less that optimistic, etc.

d) An additional check was to review the submitted spreadsheets vs. RMO registered Risk Log numbers, to ensure all items were captured in the risk register.

e) OPG was conducting various model inputs integrity reviews during the model development and contingency calculation, in parallel Senior consultant from the Palisade’s software did various overall quality check of the physical model and the formulas. At the time of writing this report is
preparing user manuals and final reports to ensure the model can be easily re-run for check estimate.

f) OPG Asset Planning and Investment group, ERM, Modus (oversight team from OPG board of directors), Mike White (oversight from MOE), and KPMG have all reviewed and endorsed this RQE NR contingency development process, content, and prudency.

4.0 MANAGEMENT RESERVE

Management Reserve (MR) is defined as an amount of project budget withheld for management control purposes. This is reserved for unforeseen work within the scope of the project (PMBOK).

Due to the “unknown, unknown” nature of management reserve, a list of management reserve drivers is developed to define necessary funding (judgment based assessment) to support NR program. This is a common practice when developing MR for capital projects. At NPET and CNO presentation of the Total Reserves for refurbishment, a total management reserves of 800M was determined to be appropriate. The presentation used and a list of management reserve drivers agreed upon with NPET is included in Appendix A.

5.0 CONCLUSION – TOTAL RESERVES ESTIMATE

The Refurbishment risk organization has performed activities in accordance with the principles of the RQE contingency development plan and outputs and process to obtain inputs are in alignment with the contingency breakdown structure diagram outlined in the contingency development plan.

Based on evaluation from Palisade, this contingency model configuration aligns with industrial best practices on mega projects. Also the level of details and integrations of schedule and cost uncertainty and risks are reflecting best practice on mega projects.

A RQE Contingency Calculation – Snapshot 3 Report, NK38-REP-09701-0566838 was captured September 30th. A MS Excel spreadsheet of the final contingency calculations is on file. This final contingency calculation was augmented with executive adjustments for a small number of emergent items as well as the Management
Reserve analysis to develop a “Total Reserves” estimate. The Management Reserve was developed using executive judgment, analysis of OPEX, and an overall assessment of appropriateness based on the number of days of potential delay and % of overall estimate to complete for the NR program. This results in a Total Reserves Estimate as outlined the RQE MCF (Master Consolidated File) “Total Reserves Summary” tab.

7.0 APPENDIX A – Management Reserve Drivers

Examples of Management Reserve Drivers/Events
This list contains some of the “unknown unknowns” that Management Reserve funds might address. It is not intended to be complete or comprehensive, and other unknown unknowns that emerge may require MR funds.

Vendor Default or Unavailability
• The risk is that a major NR vendor becomes unwilling or unable (e.g. bankruptcy, takeover, change of business philosophy or strategy) to execute the work they have been contracted to perform, resulting in a need to secure a new qualified vendor to perform the scope of work.

Labour Environment
• The risk is that future challenges in the labour relations environment results in work slowdowns, stoppages, or work to rule action during refurbishment increasing costs and extending schedule.
• The risk is that illnesses (such as pandemic flu) cause delays and cost overruns due to shortage of workers.

Political Environment
• The risk is that changes in the political landscape impact or delay the project, resulting in cost increases/impacts.

Nuclear Safety and Security
• This risk contemplates an event where an external entity or regulator, such as the MOL, shuts down all work and OPG cannot gain approval to proceed resulting in financial impacts and schedule delays due to stand downs.
• The risk is that, due to an international or localized event (such as terrorism) site security requirements (or the application rigor of the existing requirements) are increased resulting in added scope, cost increases, and schedule delays.
• The risk is that international or localized events or criminal acts (such as a military coups, piracy, or theft) impact the delivery or availability of required materials or resources for the project impacting cost and delaying schedule.
• Impact due to nuclear event. The risk is that a new nuclear event or accident, whether at an OPG site, another CANDU facility or in the international nuclear community, may delay the refurbishment due to negative public perceptions, new requirements, etc.

Force Majeure
• The risk is that a force majeure event such as an earthquake, tornado, flood, extreme/beyond normal weather conditions or other such happening results in a need to perform significant rework to get the project back up and running. This assumes that there remains a business case to complete the Refurbishment after the damage from the act of god is assessed.

Financial Factors
• The risk is that financial factors outside the control of the project (i.e. such as escalation or interest fluctuations beyond those assumed in the development of the RQE base estimate) have a significant impact on the cost of the project.

**Exploded activity plan**
### In Progress Contingency Plan for HFD

**ALARA review has been completed and assessed the Horizontal Flux Detector Replacement Program to result in 115 rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.**

Due to the highly radioactive nature of the flux detectors, there is a possible schedule delay during execution of FD removals if a detector becomes lodged, stuck, or broken within the chopper tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (e.g. mirror blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety related drive mechanisms to allow use of a travelling robotic assembly.

The purpose of this risk is to document the potential schedule and cost delays associated with unforeseen failure of the chopping tool. EDOT 20NOV2015: This risk is also associated with HFD schedule delays due to radiological interferences with RFR.

This risk is associated with the possible damage to RM Drive Mechanisms during handling (i.e. removal and reinstall of AA Drive Mechanisms) as well as surrounding work during AA rod replacement and VFD replacement work.

**Possible deterioration of existing cable insulation (from the Flux Detector to the Amplifier) when replacing Flux Detectors because aged cable insulation may be very fragile and breakdown upon contact.**

**Due to the high number of interferences in the SDS2 Bunker and inability to perform real life training in situ, an HFD mock up is being planned and constructed at the MCDF in order to aid both Refurb and VFD replacement work.**

**This action is associated with Risk ID 14207. Contingency planning for stuck detectors during the HFD replacement window will need to be established prior to executing the work.**

**There are no Not Started, In Progress Actions associated with the risk.**

### Risk Report by Project with Associated Actions

**Report Owner:** J.Stopar 30 SEP 2015 : the Unit 2 Level 1 is still under development and the execution schedule must be set before meaningful discussions can take place with the Fuel Handling Dept which is the owner of the RMD rehearal Facility.

**Comments:**

- VFD and HFD Mock-ups exist in Turbine Hall. Arrangements for shared use required.
- EDOT 30 SEP 2015 : the Unit 2 Level 1 is still under development and the execution windows for Adjusters, VFDs are being shifted. The schedule must be set before meaningful discussions can take place with the Fuel Handling Dept which is the owner of the RMD rehearal Facility.

**For Internal Use Only**
Risk Report by Project with Associated Actions

### Risk of First Time Full Scale Horizontal Flux Detector Program (Window #73)
Although ICFD's have been maintained at ONGS, they have not been replaced on a large scale addressing productivity issues, personnel (dose) and coordination with other work groups and projects.

<table>
<thead>
<tr>

<td>John Stopar</td>
<td>George Naguib</td>
<td>30-Jun-16</td>
<td></td>
</tr>
</tbody>
</table>

There are no Not Started, In Progress Actions associated with the risk.

### Cooling and Design network (Window 28, 73)
The risk is that due to complications with storing the In-Core Flux Detectors in the Irradiated Fuel Bay, rework on design may be required to revise the tooling. Should this occur, the impact will be to perform design that is above and beyond the current understood scope.

</tr>
</tbody>
</table>

There are no Not Started, In Progress Actions associated with the risk.

### ICFD Installation Challenges (Window 28 and 73)
There is OPEX which indicates that installation of longer Horizontal detectors, with a dry moderator, may be presented by major challenges due to sagging of horizontal ICFD guide tubes. A response to this challenge may include delaying longer detector installations until after moderator fill. OPEX indicates the possibility that guide tube sag is less apparent with a full moderator. This would have possible impacts to the overall outage schedule if detector installs are pushed out.

<td>3-Jun-16</td>
<td></td>
</tr>
</tbody>
</table>

There are no Not Started, In Progress Actions associated with the risk.

### Risk of Stuck Detector During HFD Program (Window 73)
There is a risk that, during horizontal in-core flux detector removals, a detector is lodged in the cutting chamber of the Stern ICFD Cutter Tool. Although the tool is built with contingency tooling for a number of "expected" stuck detector positions, contingency planning is required for a variety of other conditions. Due to the already high doses in the SDS2 bunker as well as significant dose rates coming off a stuck detector, contingency planning will need to involve minimizing the amount of time personnel are in the vicinity of the tool, as well as a well documented process for safe storing the area in the case of stuck detector challenges.

<table>

<td>John Stopar</td>
<td>George Naguib</td>
<td>30-Jun-16</td>
<td></td>
</tr>
</tbody>
</table>

There are no Not Started, In Progress Actions associated with the risk.

### Risk of New flux detectors installed in incorrect location (window #28 and #73)
This risk is associated with the possibility of installing new flux detectors in the wrong location. Detectors are similar in fit and can be easily misidentified. This applies to both vertical and horizontal flux detector programs.

There are no Not Started, In Progress Actions associated with the risk.

### Horizontal Flux Detector Guide Tube Replacement (Window 72)
The risk is that the horizontal flux detector (HFD) guide tubes will need to be replaced. A calandria tube to HFD gap measurement is currently being completed by INS to determine if there is a need to replace the HFD guide tubes. HFDs are prone to sag as calandria tubes are, which may result in contact between calandria tubes and HFDs during normal operation (sag until contact) or during refurbishment by removal or installation of calandria tubes.

### Project: Balance of Plant - BP
ASDC ICFD - Final TISA registration of Stress Analysis will cause rework to design (Window 90)
ASDC, TISA Registration carried through design completion is provisional, as the stress analysis performed made several assumptions to defer incorporation of Level D Waterhammer, LRV Loads, SDC HXs replacement, BHS modification. There is a risk of:
1. rework of the ASDC final stress analysis to include the above as required for the final registration of the modification. This final stress analysis shall include the stress signals of the other modifications (LRV, SDC HXs replacements, BHS, LOHIF and NBS100 analysis). Impact is additional cost to design.
2. potential change in pipe schedule to Class 1, additional supports or reconfiguration of supports. Impact is additional cost to design as well as procurement.

Risk Report by Project with Associated Actions

73592 - Containment project SID 7010  Procurement Risk for 18’ AQOs [No Window Related]
The risk is that late delivery (and subsequent replacements) of the 18’ 3-Way AOVs will impact vault atmosphere during refurbishment. For Containment SAE 7010, due to DNGS OPEX, the 18’ valve originally specified was found unsuitable for this application. A different valve was recommended. The tech. Spec. is being prepared by contractor, review by HSL design and OPG. The procurement of the valve may be delayed due to the availability of the tech spec. Current quoted lead time is approximately 4 months. The work was originally scheduled to start after Q1641 (July 2016) impact. The installation schedule will be determined after the firm delivery date is available.

Active Scott Guthrie See Sham 06-Apr-16 Mitigate 18-May-16 4 2 6 12 2 2 2 4

There are no Not Started, In Progress Actions associated with the risk.

Conventional Electrical Project (Project # 73762) Hydro One work protection requirements in switchyard [Window 4, 126, 127]
It has recently been determined that OPG owned equipment in the switchyard is in an area requiring Hydro One work protection. Typically these areas require the work to be performed by Hydro One and not by OPG or its contractors. It is most likely to be performed by contractor, but the deliverables that are part of all refurbishment work (CWPs, ITPs, procedures) would likely not be required.

Active Scott Guthrie Greg Mills 11-Apr-16 Accept 30-Jun-16 4 2 6 12 4 4 2 4

There are no Not Started, In Progress Actions associated with the risk.

AA Replacement Staff Experience (window #21)
This risk is associated with the introduction of new tooling and procedures to staff with little experience in performing the work. AA Rod Replacement has never been performed at Darlington and is new to the contractor.

Active John Stopar George Naguib 26-Apr-16 Mitigate 31-Oct-16 4 4 2 1 1 2

There are no Not Started, In Progress Actions associated with the risk.

Risk of not having qualified procedure staff in time to complete procedure updates for BOP projects [No Window Related]
Resource availability in the procedure group currently pose as a risk. Qualified procedure staff is required to complete procedure updates for BOP projects. The impact is that without the procedures updated and available in Passport, there is a chance that the work will not be accepted resulting in a delay to execution.

Active Scott Guthrie Kevin Tse 08-Apr-16 Monitor 31-May-16 3 2 5 12 3 2 5 12

There are no Not Started, In Progress Actions associated with the risk.

73592 - Vault Work Interferences with JV Work [Window #]
BOP project work will get delayed due to JV work being on critical path, this will lead to a contractor stand down resulting in additional costs and schedule delays. This will affect the vault work for the containment projects, e.g. Installation of the manifolds, roll-up doors at the airlocks and transfer chamber doors.

Active Scott Guthrie See Sham 11-Feb-16 Monitor 30-Jun-16 3 1 4 12 3 1 4 12

There are no Not Started, In Progress Actions associated with the risk.

ISCH - Late Materials as a result of late issuance of PO to Manufacturers [Window 130, 124]
There is a risk that due to the late issuance of manufacturing POs and EC revisions, materials will need to be expedited in order to arrive on time for execution. This will require funding above and beyond the estimated cost of materials.

Active Scott Guthrie Diana Iida 20-Apr-16 Monitor 10-May-16 3 2 8 12 2 2 3 8

There are no Not Started, In Progress Actions associated with the risk.

Vendor Material Tracking/Time Delivery for Execution
The Procurement Tracking Tool (PTT) is now in place however and data populated however a large number of BOP POs have not been issued resulting in a risk that materials will not be available within 90 days prior to the applicable outage window. Weekly tracking of PO issuance and systematic material delivery risk audits are required to mitigate the overall risk. Vendors have demonstrated a number of areas where they are not yet adequately managing procurement and hence the material procurement schedule remains at risk.

**Notes:**
- There is a risk that there will be intent and non-intent field changes based on Campus plan OPEX. Based on Campus plan OPEX, there is a significant risk that intent and non-intent field changes could result in cost and schedule challenges for BoP.
- The risk is that scaffolding materials are underestimated, and will not be available to perform the work. This will create project delays and cost increases.
- OPG assessing may result in changes to when work can be performed in the execution windows. It may impact on what the vendor had assumed on the current task sequence schedule. Will continue to monitor the level of assessing completed by OPG.

**Run by:** For Internal Use Only
### Risk Report by Project with Associated Actions

#### High Dose for HFD Program

- **Project 73750 Valve Rehabilitation**
  - **Description:** The Valve Rehabilitation Project covers 80 valves - a subset are subject to replacement with new. A number of replacement valves are not available like for like with the original, and are being addressed with NICRs. During preparation of the NICRs as part of the procurement process, it became known that some replacement valves have significantly higher weights than the original valves. There is a risk of system modifications due to increased weight impacting on system stress reports/seismic analysis/allowable stresses.

  - **Status:** In Progress
  - **Action Title:** Engagement of Construction Interfaces to issue POs for new valve replacement.
  - **Action Description:** Engage Construction Interfaces to issue POs for new valve replacement due to increased weight.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

- **RTE project and breaker open Construction interface areas have been confirmed and estimated in Fox's latest Class 3 estimates. Implementation of the RTE Construction Interfaces and a transition to result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.**

  - **Status:** In Progress
  - **Action Title:** Action ESFOX to issue POs for ASDCH components/equipment.
  - **Action Description:** Issue POs for ASDCH components/equipment.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

  - **Notes:** ALARA review has been completed and assessed the Horizontal Flux Detector Replacement Program to result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.

#### Radiation Protection Risks with Flux Detector Removals

- **Description:** Due to the highly radioactive nature of the flux detectors, there is a possible schedule delay during execution of FD removals if a detector becomes lodged, stuck, or broken within the chopper tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (ie. minor blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety-related drive mechanisms to allow use of a travelling robotic assembly.

  - **Status:** In Progress
  - **Action Title:** Contingency Plan for HFD Replacement.
  - **Action Description:** This action is associated with Risk ID 14207. Contingency planning for stuck detectors during the HFD replacement window will need to be established prior to executing the work.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

  - **Notes:** There are no Not Started, In Progress Actions associated with this risk.

- **Removals (Window 122)**
  - **Description:** There is a risk that ownership of Construction Interfacing is not clear, and as a result, not captured the entirety of cost (all windows). RTE project and breaker open Construction interface areas have been confirmed and estimated in Fox's latest Class 3 estimates. Implementation of the RTE Construction Interfaces and a transition plan to ensure all remaining Construction Interface areas are ready prior to breaker open is required to ensure gaps are not discovered during field execution (when opportunities to mitigate are more limited). In addition, proactive planning for trades on-boarding, skillset confirmation (VBO lessons learned) and supervisory effectiveness training are required to ensure success in the field. These areas remain a risk until planning is re-verified.

  - **Status:** In Progress
  - **Action Title:** Action ESFOX to issue POs for ASDCH components/equipment.
  - **Action Description:** Issue POs for ASDCH components/equipment.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

  - **Notes:** There are no Not Started, In Progress Actions associated with this risk.

#### Radiation Protection Risks

- **Description:** There is a risk that removals of redundant components (all windows) will result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker. ALARA review has been completed and assessed the Horizontal Flux Detector Replacement Program to result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.

  - **Status:** In Progress
  - **Action Title:** Engagement of Construction Interfaces to issue POs for new valve replacement.
  - **Action Description:** Engage Construction Interfaces to issue POs for new valve replacement due to increased weight.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

  - **Notes:** ALARA review has been completed and assessed the Horizontal Flux Detector Replacement Program to result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.

#### Radiation Protection Risks

- **Description:** Due to the highly radioactive nature of the flux detectors, there is a possible schedule delay during execution of FD removals if a detector becomes lodged, stuck, or broken within the chopper tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (ie. minor blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety-related drive mechanisms to allow use of a travelling robotic assembly.

  - **Status:** In Progress
  - **Action Title:** Contingency Plan for HFD Replacement.
  - **Action Description:** This action is associated with Risk ID 14207. Contingency planning for stuck detectors during the HFD replacement window will need to be established prior to executing the work.
  - **Owner:** John Stopar
  - **Delegate:** George Naguib
  - **Due Date:** 30-Jun-16

  - **Notes:** There are no Not Started, In Progress Actions associated with this risk.

#### Potential Delays of the ASDCH pump-motor assemblies delivery (Window 12H)

There is a risk for the small valves (NC1) required for draining/filling of the ASDCH pump-motor to be procured late considering the time KSB needs them for the equipment FAT testing. If this risk occurs, then ASDCH pump-motor assemblies delivery may be delayed. There is an additional cost associated with this strategy due to ES Fox overhead.

**Action#** | **Status** | **Action Title** | **Action Description** | **Owner** | **Delegate** | **Due Date** | **Comments**
--- | --- | --- | --- | --- | --- | --- | ---
4 | Active | Katie Stewart | Finalize procurement strategy for ASDCH pump-motor assemblies delivery | Diana Idita | 20-Apr-16 | 29-Apr-16 | 3 1 3 2 2 1 2 4

Response startup for this risk is to mitigate the impact: 1. Finalize the design specification for those specific small valves. 2. Engage EPC vendor to investigate market for the available vendors, issue the RFQ and award the PO to that vendor who can meet the bid evaluation criteria and the required lead time to avoid the delay in ASDCH pump-motor assemblies delivery.

Katie Stewart  
Diana Idita  
30-May-16  

1. Design specification complete and to be accepted by OPG  
2. OGP has been engaged in conversations with ES Fox and the PO is imminent  
Due date extended until confirmation received on delivery date.

---

#### F3332 - Fire Penetrations Barriers Inspections Inadequate Resources [No Window Related]

The risk is that there are inadequate resources in NR Design & Field Engineering (FE) for the work under IIP-OI-006 and the required work will not be finished on time. The work was significantly increased due to newly revealed scope as per NKB-CORR-09701-0554318 (Attached). In addition to the above scope, it was realized by Design that there were many penetrations missed in the first phase of inspections by FE so a new plan was developed to re-inspect the rooms with the help of Design as per NKB-CORR-09701-0524472 (Attached). There is a risk that many new penetrations will be discovered and FE will have to re-inspect all rooms instead of using a sampling criteria as outlined in the attached memo.

If FE is required to re-inspect all rooms (even low risk) then this will significantly increase work for FE, Design & Projects and cause further schedule delays. This is a risk because IIP-OI-006 commitment is to be fulfilled by the end of 2016.

#### Conventional Electrical (Project # 73618) Contract Award Delays Leading to Material Delay Risk (Window 4, 126, 127)

Risk is that delays in awarding BOP Electrical scope to a Contractor will result in missing material order milestones and therefore material late on site for work. Ongoing delays as a result of constant scope change, discovery items and work protection concerns has resulted in several "restarts" on the process of awarding work. Work has been on the verge of being awarded several times and then cancelled due to discovery of new scope or some other form of concern to the organization. In the last month discovery of work protection complications has resulted in additional delays to preparation of award package.

---

#### Reactivity Deck Training Location (No Window Related)

The risk is that current facilities are insufficient for reactivity mechanism training. In the event that the EPC contractor cannot use the existing DNGS training facility, a new facility would be required. This would cause significant cost increase to the project.

- Data bumped out to June 30.
- For Internal Use Only

---

**For Internal Use Only**

---

**Report ID:** Risk Report by Project with Associated Actions

**Report Owner:** L. Greenland

**Process Owner:** R. Smith

**Data Refreshed:** 12-May-16 10:30 PM

**Attachment:** Exhibit L, Tab 4.3, Schedule 1 Staff 073

**Page:** 1 of 1
Risk Report by Project with Associated Actions

**ASDCH pump-motor CSA certification at risk to be rejected [Window 124]**

There is a risk that: - KSB request for CSA certification of the ASDCH pump-motor to be rejected CSA as KSB is a European vendor. If this risk occurs, then a major design re-work will be required. - cost of increase of the KSB pump-motor for ASDCH due to the CSA certification requirements.

There is a need to engage a third party to prepare a report proving the equivalency between the European (used for manufacturing of the pump-motor assemblies) and north american standards.

**ICFD Lemo Connector Corrosion [Window 28]**

OPEx from previous ENRA ICFD work indicates that there may be heavy corrosion on the I2 ICFD assembly heads, and more specifically on the lemo connectors. This risk is identified for contingency planning in case lemo connectors need be replaced. In more severe corrosion cases, single well may need to be abandoned if detectors cannot be installed.

**HFD Installation Challenge due to sagged guide tube [Window 73]**

There is OPEx which indicates that installation of longer Horizontal detectors, with a dry moderator, may be presented by major challenges due to sagging of horizontal ICFD guide tubes. A response to this challenge may include delaying longer detector installations until after moderator fill. OPEx indicates the possibility that guide tube sag is less apparent with a full moderator. This would have possible impacts to the overall outage schedule if detector installs are pushed out.

**Risk of Stuck Detector during HFD Program [Window 73]**

There is a risk that, during horizontal in-core flux detector removals, a detector is lodged in the cutting chamber of the Stern ICFD Cutter Tool. Although the tool is built with contingency tooling for a number of "expected" stuck detector positions, contingency planning is required for a variety of other conditions.

Due to the already high doses in the SDS2 bunker as well as significant dose rates coming off a stuck detector, contingency planning will need to involve minimizing the amount of time personnel are in the vicinity of the tool, as well as a well documented process for safe clearing the area in the case of stuck detector challenges.

**KARA risks associated with AA replacement project [window 201]**

Due to the nature of the AA replacement work, there is a potential for contamination spread and a risk of unplanned exposure during the removal process.

**Risk that detector does not meet specification [Window #129]**

There is a risk associated with the performance of the selected fisson detectors such that they will not provide the functionality required by the specification.

**Horizontal Flux Detector Guide Tube Replacement [Window 73]**

The risk is that the horizontal flux detector (HFD) guide tubes will need to be replaced. A calandria tube to HFD gap measurement is currently being completed by IHS to determine if there is a need to replace the HFD guide tubes. HDFs are prone to sag as calandria tubes are, which may result in cutting chamber of the Stern ICFD Cutter Tool. Although the tool is built with contingency tooling for many of these will be met through MITP. Risk is considered low but will be monitored through to UL listing. This action will not be completed until ULL is received TCD: August 2017.

## Project: Balance of Plant - 73782

### Vendor Material Tracking/Timely Delivery for Execution
The Procurement Tracking Tool (PTT) is now in place however and data populated however a large number of BoP POs have not been issued resulting in a risk that materials will not be available within 90 days prior to the applicable outage window. Weekly tracking of PO issuance and systematic material delivery risk audits are required to mitigate the overall risk. Vendors have demonstrated a number of areas where they are not yet adequately managing procurement and hence the material procurement schedule remains at risk.

### Unique Components Rehabilitation (Project # 73782) Potential delay to project due to material not on site (Window 10M)
The risk is that material on site milestones may be missed due to material lead times, and delays in establishing a PO to the OEM. This risk is against the Unique Components Rehabilitation Project (A 73782) and is specific to the EP modules which are being ordered by E.S. Fox from Mirion Technologies. It was originally planned to issue the material PO for the modules in May/June 2015 (Phase 2) and therefore no order of long lead materials was required during Phase 1. However, the completion of Phase 1 was delayed, and the PO for Phase 2 was also delayed. As such, the original material order date (late July 2015) was missed. Fox issued a PO to Mirion which took additional months to be approved with a promised delivery date of November 2017. A meeting at E.S. Fox’s location in Niagara was held with Mirion representatives. A plan was worked out to move delivery to June 5. This should meet the installation related deadlines. As of yet, the PO has not formally been changed to this delivery date. There is a on-going risk that additional problems or delays will jeopardize this date.

### Project: Balance of Plant - 73750

- **Risk:** Long lead materials not received in time to support the valve rehabilitation without scheduling impact due to lead times greater than 52 and up to 80 weeks. This may result in a delay in ability to complete scope - increase to 90%.
- **Cause:** There is a potential for delay on the materials on the Valin PO.

</table>

*Note: The table above includes only a subset of the actions and risks discussed in the report. Additional actions and risks may be present in the full document.*
**Risk Report by Project with Associated Actions**

**Project 73750 Valve Rehabilitation - Risk of Increased Cost Due to Valve/Actuator Discovery**
Project covers 86 valves - a subset are subject to replacement with new. A number of replacement valves are not available for use with the original valves. During preparation of the NICRs as part of the procurement process, it became known that some replacement valves have significantly higher weights than the original valves. There is a risk of schedule impacts due to increased weight impacting on system stress reports/analysis/calculation stresses.

<td>M Hodges</td>
<td>19-Apr-16</td>
<td>Monitor</td>
<td>There are no Not Started, In Progress Actions associated with the risk.</td>
</tr>
</tbody>
</table>

**Event - Temporary facilities on site prove to be inadequate. Much of the valve work will need to be performed “on-site” (due to contamination and logistics of welded in valves) as there is limited space during refurb. This may result in increased cost and schedule to remove valves off site (i.e. decontam / ship contaminated valves off site). This may affect the following windows: 29, 48, 54, 57, 103, 104, 122, 124, 131

**Cause - Inaccurate drawings leading to valve to actuator fit up problems. Actuators may not be adequate for new valves and may need to be replaced.**

**Impact - Additional facilities required causing schedule and cost impact.**

</tr>
</tbody>
</table>

**Event - Valves will be replaced / repaired / overhauled as per the current approved scope. During this work, there is the potential for “discovery” issues to arise that will need to be addressed in order to return the valve to proper working order (either the valve or the actuator). This ‘discovery’ work will result in additional cost or schedule delay. May also result in NICRs being required. This may affect windows: 29, 48, 54, 57, 103, 104, 122, 124, 131

**Cause - Obsolete parts**

**Impact - The realization of this risk would lead to increased cost and added delays to schedule.**

</table>

**Event - Implementation of tenting for contamination control may require a modification. Activities that may cause loss/airborne contamination include use of an air grinder for valve overhaul. This may affect windows: 29, 48, 54, 57, 103, 104, 122, 124, 131

**Cause - Procedures drive the requirement for a temporary modification.**

**Impact - Cost impact due to additional resources needed for TMOD.**

## Risk Report by Project with Associated Actions

**Project:** Risk of Fire Protection External Repair Scope

The risk is that the Primary Heat Transport (PHT) Pumps disassembly/assembly tools required for PHT pump inspection and maintenance will not be readily available at the station. In the event of a forced outage, station maintenance will need to take back the PHT Pump tools for use of seal replacement. This will lead to a contractor stand down until the PHT Pump tools can be obtained to continue PHT pump inspections.

### Actions

<td>Completion of the final fire penetrations and construction joints is required to assess the extent of repair scope. The first action is to complete the inspections TC21 Aug. 15. Upon completion of that activity, the action ID will be updated to status when Engineering will complete the inspection analysis to confirm repair scope. That TCO will be established once the inspection reports are generated. Update : OPG Field engineering providing the inspection service. Commencing Jan 2016. Expected finish, first quarter 2016. Inspection analysis ongoing.</td>
<td>Scott Guthrie</td>
<td>Gary Grahn</td>
<td>30-Jun-16</td>
<td>Extent of penetrations/construction joints confirmed. Soil being drafted to obtain selective sampling to confirm EOC for Skid/links. Data extended to Jan 2016 to allow for Soil finalization, contract issuance and status of sampling findings.</td>
</tr>
</tbody>
</table>

### Infrastructure

#### PHT Pump Dismantling Tools Unavailable (Window 4B)

The risk is that the Primary Heat Transport (PHT) Pump disassembly/assembly tools required for PHT pump inspection and maintenance will not be readily available at the station. In the event of a forced outage, station maintenance will need to take back the PHT Pump tools for use of seal replacement. This will lead to a contractor stand down until the PHT Pump tools can be obtained to continue PHT pump inspections.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 30-Jun-16
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### Procurement Uncertainty

#### PHT Pump Component

The risk is that there is an uncertainty in the cost of material procurement for the PHT Pump Long Lead components (15 month lead time). Funding was approved in Phase 1 to complete the purchase of the materials but the estimate from the OEM was a class 5 and did not include all the regulatory license approvals.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 31-May-16
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### EHS Project - Instability to Perform Construction Walkdown (Windows 4B, 5A)

The risk is that there has not been a construction walkdown held for the Class 1 portion of the modification due to no planned Unit 2 outages available during the detailed design phase. The design and construction team have not be able to get into the reactor vault, therefore the design is based on available pictures and laser scans for piping layouts and supports. There is a large risk of interferences being present in the current piping runs which are not clearly visible from available pictures.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 31-Dec-18
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### PHT Project - Switch Module Replacements (Window 4B)

The risk is that during the replacement of the Primary Heat Transport (PHT) pressure switch cables, the alarm switch modules will also require replacement due to degradation over time.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 31-Jul-17
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### EHS - DEC Revisions due to Unavailability of Vendor Information (Windows 4B, 5A)

The risk is that DEC revisions will be required due to the unavailability of vendor information. The design of the EHS piping and support structures depends on the dimension and weights of the material components (such as manual and check valves, and other items). These items will not be available until 4-6 weeks into procurement of the components, however P0s have not yet been issued for them (in progress).

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 31-Aug-16
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### B09 LS, Risk of 7200-2223 passing during Refurbishment Outage on units 184 [Window 53]

Impact to B09 LS Replacement - There is a risk that B090-V223 will not provide sufficient isolation to the branches from the main header. V223 was replaced in all units during Vacuum Building Outage (Fall 2015), and will be used during refurbishment to provide isolation during replacement of B09 LS. V223 could only be inspected/replaced during VBO as all units have to be shutdown. This risk applies to future refurbishment outages units 184 as there is potential for V223 (butterfly valve) to degrade over time and not provide sufficient isolation.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 31-Jan-22
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

### B09 & Aux. - PHT Pumps will require Repairs (Window 4B)

During DNN22 a single PHT Pump (2-31320-P3) will be inspected to determine the condition of the pump and if any contingency repairs are required. The risk is that the 2-31320-P3 is in poor condition and will require full repairs. This will lead to inspections of 2-31320-P1/P2/P4 and potential additional repairs.

- **Active:** Scott Guthrie, Jessica Perryman
- **Due Date:** 30-Jul-17
- **Comments:** There are no Not Started, In Progress Actions associated with the risk.

---

### Construction Interfaces

- The risk is that ownership and funding streams for various construction interfaces are unclear. As a result, the vendor was asked to remove C1 costs from bids until clarity can be attained.
- The Risk is that the project team will be taking on the effort for the commissioning work plans due to limited OPG resources (all windows).
- The risk is that the tools being used for the commissioning work plans are not adequate. This will lead to inspections of 2-33120-P1/P2/P4 and potential additional work.

---

### Seismic Risk

- The Risk of these events has been mitigated by the following considerations:
  - The seismic requirements for use of the RM flask over the RMD.
  - Due to the seismic requirements on the RMD, an assessment to confirm no seismic risk is imposed on reactor mechanisms and associated equipment, as a result of AA rod removals from the reactor core.
  - The risk is that items to be procured by the Balance of Plant Project may have lead times greater than expected.

---

### Windows

- The Risk is that there is a possibility of a breach occurring in the window.
- The Risk is that the window may be subject to a severe transient situation to the Plant and would likely require the use of a Group 2 Heat Sink in order to maintain Nuclear Safety.
- The Risk is that items to be procured by the Balance of Plant Project may have lead times greater than expected.

---

### Conclusion

- There are no Not Started, In Progress Actions associated with the risk.
- The Risk is that the window may be subject to a severe transient situation to the Plant and would likely require the use of a Group 2 Heat Sink in order to maintain Nuclear Safety.
- The risk is that the project team will be taking on the effort for the commissioning work plans due to limited OPG resources (all windows).

**Report ID:** 0707A  
**Tech Tips**  
**Report Owner:** L. Greenland  
**Process Owner:** R. Smith  
**Data Refreshed:** 12-May-16 10:30 PM

---

### RM Drive Mechanism Damage due to handling and AA Replacement work [window #21 and #28]

This risk is associated with the possible damage to RM Drive Mechanisms during handling (ie. removal and reinstal of AA Drive Mechanisms) as well as surrounding work during AA rod replacement and VFD replacement work.

**Status:** Active  
**Action:** Mitigate  
**Due Date:** 31-Oct-16  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### ALARA Risks Associated with AA Replacement Project [window #21]

Due to the nature of the AA Replacement work, there is a potential for contamination spread and a risk of unplanned exposure during the removal process.

**Status:** Active  
**Action:** Mitigate  
**Due Date:** 30-Jun-16  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### Integration Risk between AA Replacement and other work groups [window #21]

There is a risk that other work groups will be affected by the AA Rod Replacement project execution (ie. flask maneuvering/transport, access control due to radiation, etc.).

**Status:** Active  
**Action:** Mitigate  
**Due Date:** 30-Jun-16  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### Adjuster Absorber Rod Drop During Replacement [window #21]

This risk is associated with the risk of dropping an adjuster absorber rod in one or both of the following scenarios: 1. Upon removal of spent AA Rods with the RM Flask. 2. Upon installation of new AA rods into the reactor core. The impact of a dropped rod may result in severe damage to the AA rod itself as well as possible guide tube and locator damage.

**Status:** Active  
**Action:** Monitor  
**Due Date:** 30-Sep-16  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### Less than Adequate AA Guide Tube Gap Inspections [window #21]

This risk is associated with the risk that the AA vertical guide tube gap inspection on AA13 guide tube at the back end of the AA replacement program results in less than adequate measurements. Although the OP3 indicates that the risk is low, there would need to be extra work planning and execution work required to fix the gap measurements and study the extent of condition.

**Status:** Active  
**Action:** Accept  
**Due Date:** 30-May-17  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### PFD Mockup for AA Replacement [window #21]

Risk is that the PFD Mockup does not adequately reflect the field interferences from surrounding mechanisms.

**Status:** Active  
**Action:** Mitigate  
**Due Date:** 31-Oct-16  
**Owner:** John Stopar  
**Delegate:** George Naguib  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### Project: Balance of Plant - 73761

- **Event - During repair work there are deficiencies found that may require repair work.**
  - **Balance of Plant** has preventive maintenance work orders assigned to the "Other" category and some of them will require repairs outside of the preventive maintenance scope. This risk could apply to windows: 81, 122, 38, 131, 29, 90, 89, 48, 46, 32, 28, 94, 55, 80, 100.

**Status:** Active  
**Action:** Accept  
**Due Date:** 16-Oct-16  
**Owner:** Scott Guthrie  
**Delegate:** M Hodges  
**Notes:** There are no Not Started, In Progress Actions associated with the risk.

### Project 7363 - Preventive Maintenance "Other" Schedule Risk [window 29, 60, 133, 090]

Event - Changes in the level 3 schedule are required due to schedule integration. When the RFP was sent out for the preventive maintenance work, assumptions were made as to when the work would be performed. Due to the numerous systems involved in the preventive maintenance work, the schedule and the associated work order could be impacted.

**Status:** Active  
**Action:** Accept  
**Due Date:** 29-Jun-16  
**Owner:** Scott Guthrie  
**Delegate:** M Hodges

<table>
<thead>
<tr>
<th>Project: Balance of Plant - 73762</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event:</strong> Preventive Maintenance - &quot;Other&quot; Parts Risk</td>
</tr>
<tr>
<td><strong>Description:</strong> It has recently been determined that OPG owned equipment in the switchyard is in an area requiring Hydro One work protection. Typically these areas require the work to be performed by Hydro One and not by OPG or its contractors. It is mostly certain at this point that the affected scope will have to be taken from AREVA who is currently the intended constructor (through no execution contract has been issued). Currently AREVA has a contract to assess and perform work planning for this and other electrical scope. Should it be confirmed that this scope will be taken from AREVA, it will have to be resourced from a different provider. Conventional Electrical work scopes, a review will be required to confirm how the vendors will effectively manage work as it changes within an outage window. This could be caused by interferences or other issues requiring work control to move the WO within the same window. To alleviate this issue, the vendor needs to have a job jar strategy in place prior to the window to prevent such issues. The work may be re-directed as required to other work or it may require additional resources.</td>
</tr>
<tr>
<td><strong>Impact:</strong> OPG is performing engineering function for this work, may require additional resources.</td>
</tr>
<tr>
<td><strong>Causes:</strong> Normal wear and tear associated with plant aging.</td>
</tr>

The document contains a risk report by project with associated actions, detailing various risks, actions, and their statuses and due dates. The report includes actions like:

- Completing a systematic review of all materials that do not have a PO issued against them to document the review.
- Identifying a subset of materials that may be at risk for delivery within the 90 day window.
- Reviewing each material subset with Supply Chain to determine extent of risk.

The report also includes a list of actions with statuses (e.g., In Progress, Active, Monitor), owners, and due dates. For example:

- Action #6546: In Progress - BoP Material Risk Review
  - Description: BoP staff to complete a systematic review of all materials that do not have a PO issued against them to document they have reviewed all items and establish a baseline tracking file using PTT.
  - Due Date: 31-May-16

The report includes multiple sections and tables with detailed information on various risks and actions. Each section contains a risk title, description, and associated actions with statuses and due dates.

---

**Risk 1:** Project 73312: Fire Penetrations

The risk is that there are inadequate resources in NR Design & Field Engineering (FE) for the work under IIP-OI-006 and the required work will not be finished on time. The work was significantly increased due to newly realized scope as per NK38-CORR-09701-0554318 (Attached). In addition to the above scope, It was realized by Design that there were many penetrations missed in the first phase of inspections by FE so a new plan was developed to re-inspect the rooms with the help of Design as per NK38-CORR-09701-0574472 (Attached). There is a risk that many new penetrations will be discovered and FE will have to re-inspect all rooms instead of using a sampling criteria as outlined in the attached memo. This is a risk because IIP-OI-006 commitment is to be fulfilled by the end of 2016. There are no Not Started, In Progress Actions associated with the risk.

**Risk 2:** Project 73312: Potential for Additional Project Staff as a result of expanded Vendor Challenges with EPC vendor capability have resulted in an increased level of project intrusiveness to validate EPC Vendor deliverable quality and confirm they are proactively managing their work. The resultant risk is that additional project staff may be required that exceed RQE FTE levels. There are no Not Started, In Progress Actions associated with the risk.
**Risk Report by Project with Associated Actions**

**Window 532 Lube Oil Tanks Possible Repairs**

The Risk is that upon inspection of the 3 Turbine Lube Oil Tanks, there will be extensive repairs required. The probability of this risk occurring is moderate to high, as OPEX from tanks in similar environments showed extensive degradation over a similar lifetime.

<table>
<thead>
<tr>
<th>[Window 532] Lube Oil Tanks Possible Repairs</th>

**Weekly review meeting underway with Fox confirming progress of strategic resourcing initiative.**

Mar 26/15 status: PMT Class 3 explicit FTE allocation confirmed against current Fox PMT team, team is approx. 50% under-resourced; however after Feb 2018 the PMT workload drop significantly. Fox to provide names of proposed PMT team and insert into PMT allocation curve to determine extent of underallocation post Feb 2018. Construction staff table received ~80% complete. Construction staff allocation table drafted and reviewed 1P Apr 17/16: Conceptual approval received from Gary Rose & Mike Allen wrt PMT/Construction team approach. Presentation to be reviewed based on feedback & final review completed Week of Apr 25 prior to requesting approval from D. Reiner. Support team Scope of Work routed for approval and draft PO sent to Fox for comment. This PO will progress Fox resources/planning in a number of areas. Lateral additional focus area is moving ahead with a look ahead team to address the trend of constructability/design issues that are causing cost & schedule delays in both SDLU & BoP projects. BoP resource has been assigned to the look ahead team, Fox and SDLU staff assignment remains pending.

May 13/16: PMT/Construction team update noted in Action 5980. QA/QC resource constraint emerging due to late ITPs from Fox. OPG has challenged Fox to find resources through other contractors. Team Industrial has been identified as a potential resource however Fox have identified conflicts with IMs use of the same Vendor. Sr Fox/OPG meeting to occur week of May 16 to review conflict area and resolve. Fox also challenged to look at other vendors.

---

**In Progress ES Fox Strategic Refurb Resource Planning**

Temporary management staff have been hired by Fox to complete a PMT & Construction resource review to provide strategic resourcing options to OPG. The scope of this investigation involves assessing FTE resources (by name) against the # of FTEs assigned in the Class 3 estimates. Opportunities to build a dedicated Refurb PMT/Construction team need to be reviewed along with under/over-allocation gaps as Unit 2 progresses to determine options to temporarily re-allocate key Fox staff as required. This will ensure experience/continuity/value for money for subsequent unit refurb outages and help to address the current experience/quality gaps for Unit 2.

**Scott Guthrie 26-May-16**

Weekly review meeting underway with Fox confirming progress of strategic resourcing initiative.

Mar 26/15 status: PMT Class 3 explicit FTE allocation confirmed against current Fox PMT team, team is approx. 50% under-resourced; however after Feb 2018 the PMT workload drop significantly. **ASDCH - Final TSSA Registration carried through design completion is provisional, as the stress analysis performed made several assumptions to defer incorporation of Level D Waterhammer, LRV Loads, SDC HXs replacement, EHS modification. There is a risk of**

1. rework of the ASDCH final stress analysis to include the above as required for the final registration of the modification. This final stress analysis shall include the stress signals of the other modifications (LRV, SDC HXs replacements, EHS, LDWH and NEB300 analysis). Impact is additional cost to design.

2. potential delay of delivery due to the lack of space in the layed-up unit will result in conflicts in the SATM/laydown area system. This could result in delays and overall issues with performing the work.

There is a risk that due to the late issuance of manfuacturing POs and EC revisions, materials will be required. This would increase project scope and schedule.

There is a risk of re-work on design EC packages which implies cost increase for their revision.

There is a possibility that lack of manufacturers'/vendors' details/information on numerous components/equipment to obtain cost increase for their revision.

1. rework of the ASDCH final stress analysis to include the above as required for the final registration of the modification. This final stress analysis shall include the stress signals of the other modifications (LRV, SDC HXs replacements, EHS, LDWH and NEB300 analysis). Impact is additional cost to design.

2. potential delay of delivery due to the lack of space in the layed-up unit will result in conflicts in the SATM/laydown area system. This could result in delays and overall issues with performing the work.

There is a risk that due to the late issuance of manfuacturing POs and EC revisions, materials will be required. This would increase project scope and schedule.

There is a risk of re-work on design EC packages which implies cost increase for their revision.

There is a possibility that lack of manufacturers'/vendors' details/information on numerous components/equipment to obtain cost increase for their revision.

**ASDCH - Final TSSA Registration carried through design completion is provisional, as the stress analysis performed made several assumptions to defer incorporation of Level D Waterhammer, LRV Loads, SDC HXs replacement, EHS modification. There is a risk of**

In Progress Resolution of operational spare parts

In Progress

Re-Filed: 2017-02-10, EB-2016-0152

There is a risk for the small valves (NC1) required for draining/filling of the ASDC pump-motor to be procured late considering the time KSB needs them for the equipment FAT testing. If this risk occurs, then ASDCH pump-motor assemblies delivery may be delayed. There is an additional cost associated with this strategy due to ES Fox overhead.

Response strategy for this risk is to mitigate the impact: 1. Finalize the design specification for those specific small valves 2. Engage EPC vendor to investigate the market for the available vendors, issue the RFP and award the PO to that vendor who can meet the bid evaluation criteria and the required lead time to avoid the delays in ASDCH pump-motor assemblies delivery.

ASDC Strategic Spare parts not available and would result in modification not accepted at APS [Not Window related]

The risk is that the ASDCH modification will not be accepted by stakeholders at APS due to an unavailability of strategic spare parts (i.e., spare pump catalog).

These spares were not ordered in time for AFS due to lack of the funding for operational spares. Refurbishment funding cannot be used for operational spares. Due to the high cost of the strategic spares, a business case must be developed and approved. Please note: 2-5 year inspection spares were purchased for ASDC.

ASDC - Execution/installation window schedule delays due to JV work [Window 130, 124]

The risk is that the Auxiliary Shutdown Cooling project will face schedule delays during the planned work windows due to the interferences with R&M/LV work. The ASDC project will get delayed due to the JV work being on critical path for a variety of reasons (i.e. 1. removal of the cable trays required for putting the power supply cables to pump-motors will be performed immediately after installation of the bulkhead, and their re-installation is plan to be done just before the PHT refit or later on, 2. getting access for the ASDC equipment and materials to SDC rooms when R&M work is at full speed, 3. work interferences in the same area of the vault) which will lead to a contractor stand down resulting in additional cost and schedule delays.

### Risk Report by Project with Associated Actions

**ADCH pump-motor CSA certification at risk to be rejected (Window 124)**

There is a risk that:
- KSB request for CSA certification of the ADCH pump-motor to be rejected CSA as KSB is a European vendor. If this risk occurs, then a major design re-work will be required.
- Of cost increase of the KSB pump-motor for ADCH due to the CSA certification requirements.
- There is a need to engage a third party to prepare a report proving the equivalency between the European (used for manufacturing of the pump-motor assemblies) and north american standards.

<td>For Internal Use Only</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ASDC CM - New Revision of ECs due to additional OGW/Design (Window 130,124)**

ASDC modification design EC packages went through DCAVR process without having associated OGW finalized (Deviation MERO approved by NE DA in effect). Based on the recovery plan, the OGW was scheduled to finalize at a later date. There is a risk of having design cost increase due to:
- the OPG OGW comments on the proposed routing of power cables and B&C wiring, comments which shall be implemented within the DEC packages as a new revision.
- the unavailability of the wires in the EP (containment penetration) selected/proposed for vibration and temperature monitoring of the pump-motor assemblies. This will be confirmed by OPG OGW group. If risk happens, then new revision of the associated design EC is required in order to include the appropriate EP. Revision of ECs will have a significant impact on procurement as well as installation planning effort.

**Project: Balance of Plant - 73308**
Risk Report by Project with Associated Actions

**Project: Balance of Plant - 73613**

Event: Additional Funding required if max performance fee will be awarded. Cause: Project funding is held back as an incentive to perform well. The maximum multiplier is which totals to a fee. This means that of contract is an additional cost to the project. This score is given when Performance indicator criteria are met. 

**Impact:** Material delay risk on schedule and cost. 

**CAUSE:** Flow Defueling will be used during the Defueling campaign which requires the continued use of the PHT pumps to circulate coolant. 

**IMPACT:** The failure of one of the PHT pumps would make Flow Defueling impossible, requiring the use of Dummy Bundle push defueling for the entire reactor greatly extending the schedule and therefore cost of the project.

## Risk Report by Project with Associated Actions

### Single Ended Flow Defuelling Not Achievable at Lower Flows in Future Units (perf. impr. opp.) 

**Window 12**

**EVENT:** The current limit for single-ended channel defuelling is not lowered for future units. Note that this does not affect the U2 base case assumptions and strategy. **CAUSE:** Currently the assumption about flow defuelling is that we can successfully flow defuelt at lower flows for future units. It is anticipated that flow requirement criteria currently used for single-ended defuelling may be reduced, resulting in some schedule improvements for future campaigns. Data and experience gathered during U2 refurbishment is planned to be the basis for determining potential for this opportunity.

**IMPACT:** This would result in the need to perform double-ended flow defuelling or the use of Dummy Fuel Bundles push defuelling either of which will result in future unit defuelling campaigns being of similar duration to U2's.

### Discovery scope for new Inverter Software 

**Window 12**

**EVENT:** Once the new Inverters are installed previously unknown scope relating the updates of Fuel Handling software are discovered that are necessary to incorporate the new inverters.

**CAUSE:** The effects on the station software of the new inverter installation cannot be completely predicted or tested.

**IMPACT:** The cost of the project would be impacted as the initial estimate was incorrect in light of the discovery scope.

Risk Report by Project with Associated Actions

### Disposal Projects - 34000

**Project: DNGS Projects - 34000**

Event: Pipe Relocation in U4 RAB
- **Event:** There is a risk that the relocation of the pipe in the U4 RAB may not be completed prior to the end of the project.
- **Cause:** Discovery of issues during design, procurement, and installation of the steam bypass line. Design solution not available at the time of committing budget and schedule.
- **Impact:** Delays to the demolition of the Construction Boiler House (CBH) and increase in cost.

### Disposal Projects - 34000

**Project: DNGS Projects - 34000**

Event: Hazardous Materials
- **Event:** There is a risk of finding asbestos and lead paint during the demolition of the existing Construction Boiler House (CBH).
- **Cause:** Field walkdowns and existing documentation do not identify the presence of asbestos prior to start of field work.
- **Impact:** Delays to the demolition of the CBH and increase in cost.

### Disposal Projects - 34000

**Project: DNGS Projects - 34000**

Event: Contamination
- **Event:** There is a risk of finding contaminated soil during the demolition of the existing Construction Boiler House (CBH).
- **Cause:** Presence of contamination is not detected prior to start of field work, due to inaccessibility for testing the soil in advance.
- **Impact:** Cost of demolition may be greater than the available budget. Delay to completion of demolition.

### Disposal Projects - 34000

**Project: DNGS Projects - 34000**

Event: Steam Bypass Line Not Completed Within Project Schedule & Budget
- **Event:** Steam bypass line is not completed within allotted project schedule and budget.
- **Cause:** Discovery of issues during design, procurement, and installation of the steam bypass line.
- **Impact:** Delay to AFS, AHS not ready for next heating steam season.

**Risk Report by Project with Associated Actions**

**Project: DNGS Projects - 31306**

- **Event:** There is a risk if PARs do not meet the performance expectations. The pilot project is being implemented in parallel with full installation and the PARs technology has not yet been tested at the area of the bridge and a new camera assessment using the CNSC approved assessment tool.

- **Impact:** There is a risk if PARs do not meet the performance expectations. The pilot project is being implemented in parallel with full installation and the PARs technology has not yet been tested at the area of the bridge and a new camera assessment using the CNSC approved assessment tool.

- **Cause:** The Contractor fixed price proposal provided February 26, 2016 has underestimated the prior to AFS.

- **Impact:** The AFS is delayed or the CATIDs are carried as an open item post-AFS.

- **Resources/schedule. Discovery issues delay the field work.

### UPS replacement cost may be increased

**Event:**
First time replacing class II Power UPS equipment may result in schedule delays and increase cost to plan the work properly.

**Cause:**
Legacy design deficiencies may be discovered as a result of detailed design and class II power load review. Material cost may be higher due to change in exchange rate. OPG oversight cost may be higher than estimated.

**Impact:**
Design is in progress.

**Project cost will be increased**

### Factory Acceptance Testing may impact Project schedule

**Event:**
Technical issues may be discovered during the Factory Acceptance Testing (FAT).

**Cause:**
- New technology equipment
- First time testing.

**Impact:**
Project schedule will require extension or realignment.

### Legacy Design Issues

**Event:**
Legacy design issues may be discovered during Detailed Design.

**Cause:**
Configuration management issue.

**Impact:**
Project schedule will be delayed and budget will be increased.

### D1641 execution schedule has no float

**Event:**
Technical issues may be discovered during D1641 execution.

**Cause:**
- Lessons learned from DLC UPS Installation
- First time installation inside unit

**Impact:**
Project schedule will require extension or realignment or may require outage window extension

### Project may require acceleration

**Event:**
Project may require acceleration.

**Cause:**
Current UPS equipment may fail.

**Impact:**
Project schedule will require realignment.

---

Run by: Run by: For Internal Use Only
### Class II Power Load Review

**Event:** Operation to complete a detailed load review of class II power system.

**Cause:** Currently operation cannot complete load reviews due to other station priorities.

**Impact:** Project schedule will be delayed

### Project: DNGS Projects - 31506

#### Discovery Work during Outage

There is a risk that the as found conditions in the Boiler Blowdown Duct Chimney are not as per the design documents and modification design cannot be installed as planned. Design changes to approved design may be needed. In addition to the design changes the work may not be completed within the allocated outage window, hence delaying the outage completion.

<td>James Mirchian</td>
<td>01-Aug-16</td>
<td></td>
</tr>
</tbody>
</table>

#### Vibration Limit exceeded

Prior to the final APS of the modification, it is planned to carry-out vibration testing of the modified piping to ensure acceptance criteria for vibration limits outlined in the Modification Design Requirements (MCR8-MDR-36410-1003, Section 2.3.2) is met. There is a risk that the system vibrations are not within the acceptance limit.

<td>Ricardo Fiorini</td>
<td>Umar Rizwan</td>
<td>30-Jun-16</td>
</tr>
</tbody>
</table>

#### No OPEX available for New Boiler Blowdown Design performance. This may result in subsequent additional inspection and system design changes

Although the design features used in the modified Boiler Blow-off system (single pipe design with flow restriction at pipe exit) are standard but there is no OPEX of Boiler Blow-off System performance with flow restriction. The Boiler Blow-off systems at Pickering and Bruce do not use flow restriction and also have more than one pipe at the exit of the Blow-off system. Additional inspections costs will be expensed after the first installation to gather OPEX and if potential issues are identified design updates for other units may be required. Potential changes to the first unit design is need for removal/re-installation.

There are no not Started, In Progress Actions associated with the risk.

Risk Report by Project with Associated Actions

Project: DNGS Projects - 31508

31508 - Delay - NV537 Installation

The installation of the NV537 modification is at risk of delay. The delay is due to a pre-existing condition where the station OM has been claiming the valve as part of containment boundary during dousing water fill operation. In the absence of resolution to the CB issue, it has not been possible to process a revision to the OM, which would require a similar containment boundary be defined. EC was approved with the condition that pre-existing station condition regarding use of V542 and NV537 as a temporary containment boundary during dousing storage tank fills was resolved. This line and associated valves are not of the required class for designation as a CB, and a plan to request an exemption for this case has been unsuccessful. This action generated out of this issue (AR 28172655-01 ) has not been resolved and next anticipated step is a CNSC submission by Plant Design on Jan 29, 2016. There is also a related risk that the results could result in rework, contributing to delay.

31508 - Fukushima Phase I

There is a risk of scope growth impacting cost and schedule of the project.

Initial scope for this project consists of numerous modifications initially provided as solutions in a "Fast track" context, rather than problems. Program is composed of numerous small modification, integration issues with the overall response drive changes. Many aspects of BDBE response are new, outside normal practices or require "extent of response" evaluation. Summary of Mitigating Response Guide procedures may cause delays and rework, impacting the final AFS and turnover for Fukushima modifications.

</tr>
</tbody>
</table>

**GFP - Antimony**

Due to the increased amount of shielding required for the GFP Sample Delay Coil to ensure 2.5 MREM working limit in room R-253, the design has to include a structural package, with calculations, to ensure safety.

This will affect cost for design, as well as extra material and labour, as this was not anticipated and was specifically noted in the assumptions of the Purchase Order with ESFox to be a PCA during detailed design.

### Risk Report by Project with Associated Actions

#### WTP - In Progress WTP - Building Footprint Verification
- **Action#**: 4485
- **Status**: In Progress
- **Title**: WTP - Building Footprint Verification
- **Description**: Review 2 story options to minimize footprint. Avoid 8kv lines. Build over duct bank instead of moving. Relocate other services as required to verify that the chosen location can accommodate the new WTP, to be dispositioned as part of art of preliminary design.
- **Owner**: John Ieraci
- **Delegate**: 01-Dec-16

#### WTP - Impact of Existing Buried Services
- **Action#**: 4487
- **Status**: In Progress
- **Title**: Underground Services
- **Description**: Areas to be scanned and existing drawings to be used. Avoid existing services as much as possible. Potentially use shallow precast duct bank for piping or above ground piping.
- **Owner**: John Ieraci
- **Delegate**: 01-Oct-16

#### WTP - Project Deferral to 2016/ New RFP strategy
- **Action#**: 4488
- **Status**: In Progress
- **Title**: Ensure Experience and Technical Expertise is highly Considered During RFP Evaluation
- **Description**: The bid evaluation will be used to assess the experience and technical expertise of the chosen Vendors and is weighted 50% of the evaluation. Where the immediate Vendor does not have the necessary in house experience, the expectation is that appropriate joint venture partnership would be used.
- **Owner**: John Ieraci
- **Delegate**: 01-Aug-16

#### WTP - Security Risks
- **Action#**: 4489
- **Status**: In Progress
- **Title**: Security Stakeholder
- **Description**: Security to be a stakeholder in early Design. Proposed Tie-in routes and details to be approved by Security.
- **Owner**: John Ieraci
- **Delegate**: 01-Oct-16

#### WTP - Project Deferral to 2016/ New RFP strategy
- **Action#**: 4490
- **Status**: In Progress
- **Title**: Environmental Stakeholder to be a key member of Project Team especially in early design.
- **Description**: OPEX available from the PNGS WTP project. Contingency.
- **Owner**: John Ieraci
- **Delegate**: 01-Dec-16

#### WTP - Station Auxiliary Services may not support requirements of new WTP
- **Action#**: 4491
- **Status**: In Progress
- **Title**: Security Stakeholder
- **Description**: Security to be a stakeholder in early Design. Proposed Tie-in routes and details to be approved by Security.
- **Owner**: John Ieraci
- **Delegate**: 01-Oct-16

#### WTP - Inexperienced Vendor
- **Action#**: 4492
- **Status**: In Progress
- **Title**: WTP - Building Footprint Verification
- **Description**: Review 2 story options to minimize footprint. Avoid 8kv lines. Build over duct bank instead of moving. Relocate other services as required to verify that the chosen location can accommodate the new WTP, to be dispositioned as part of art of preliminary design.
- **Owner**: John Ieraci
- **Delegate**: 01-Dec-16

#### WTP - Regulatory Risk
- **Action#**: 4493
- **Status**: In Progress
- **Title**: Regulatory Approvals (TSSA, CNSC, Municipality, Fisheries etc.) to be identified and requested early in design phase. Allow sufficient time in the schedule for regulatory approvals.
- **Owner**: John Ieraci
- **Delegate**: 01-Oct-16

#### WTP - Environmental Risk
- **Action#**: 4494
- **Status**: In Progress
- **Title**: Environmental Stakeholder to be a key member of Project Team especially in early design.
- **Description**: OPEX from the PNGS WTP Project to be used. Allow sufficient time in the schedule for regulatory approvals.
- **Owner**: John Ieraci
- **Delegate**: 01-Oct-16

---

**Notes:**
- All actions are currently not associated with any risk.
- There are no Not Started, In Progress actions associated with the risk.

<td>Confirm if WTP de-commissioning/dismantling will be part of overall project scope. Include contingency to cover costs.</td>
<td>John Ieraci</td>
<td></td>
<td>01-Dec-19</td>
<td></td>
</tr>
</tbody>
</table>

### WTP - MDRI does not correctly specify WTP requirements

WTP MDR will specify a new technology for DNGS (Reverse Osmosis). In addition, considerable effort is required to ensure correct performance and water quality requirements are specified correctly. MDR is also heavily influenced by the proposed Vendor Contract strategy (Design/Build/Own/Operate (DBOO) or simply Design/Build). Improper MDR will result in increased costs and schedule if re-work and re-design is required.

<td></td>
</tr>
</tbody>
</table>

**Possible Discovery Work during Installation - 31536**

- There is a risk that the installation costs for the remaining units would be higher than the estimates due to potential installation delays. Since Unit 2 is not identical to the other three units, there is a possibility of discovering new work during installation and commissioning.

**Possible Oil Spills during Installation - 31536**

- Oil spills may occur during the removal & installation of equipment or piping modification. The spill may cause a physical, fire or environmental hazard.

**Possible Oil Spills during Installation - 31536**

#### Comments

**ES Fox notified OPG that the Detailed Design Milestone of Jan 22, 2015 will not be achievable as the Turbine OEM documentation/deliverables are critical path and are required for AHEC to complete. Detailed Design, refer to SCP-N 2015-15888. Project has prepared a directed change PCAAF 04 to realign vendor project schedule and yearly cash flows as the TRF T1601 Outage window has been moved/pushed to TRF T1701 Outage (start Feb 08, 2017). As a result this should recover the Detailed Design Milestone based on the new T1701 Outage Start Date. New Detailed Design Milestone TCD is July 08, 2016. In Q3-2016 the Project has received new Production Schedule from ES Fox now targeting the Detailed Design complete date as 26-May-2016, which is in advance of the OPG Milestone 08-July-2016.**

## Project: DNGS Projects - 31706

### 31706 - DN VP Button Up Valve: There is a risk that modification with heavier components may require seismic requalification of the Class 2 piping system and associated supports

There are heavy components involved in modifications on this project. As a result, there is a risk that seismic requalification of the Class 2 piping system and associated supports may be required. This would be caused by the heavy components weighing sufficiently enough to require the requalification. This would result in increased project costs potentially a delay project schedule.

<td></td>
<td></td>
</tr>
</tbody>
</table>

### 31706 - DN VP Button Up Valve: There is a risk that unknown interferences will be encountered during installation since not all locations were walked down during Preliminary Engineering phase

Not all of the planned installation locations for the Vapour Recovery Button Up Valves were walked down during the Preliminary Engineering phase. This could result in interferences arising during the installation phase of the project due to lack of knowledge of the installation areas. This would be caused by conditions being discovered during installation which are not documented in the plant design documentation. This could result in field initiated changes, re-work, a delayed project schedule, and consequently, increased project cost.

### 31706 - Lack of engineering resources to initiate project

Projects Design & supporting the preliminary engineering (MO, MDR, and SOW). This resource group has a full work load. Any emergent issues on other projects could divert resources away from this project, since this project is of lower priority. The consequence would be schedule slippage.

**Comments:**

- There are no Not Started, In Progress Actions associated with the risk.
### 31710 - Resources

#### Inevitable if Work Moves

If the project has to move the SDC HX replacement work late into refurbishment due to failure to obtain isolation, or due to schedule delays preventing execution prior to Refurbishment, there is a risk that refurbishment resources (Operations, Maintenance, Design, Field Engineering, Contract Management Office, Radiation Protection, etc.) are unavailable to provide support during a 2 month long 24/7 execution periods that are back to back (1.5 month gap in between).

#### 31712 Degraded PULSW Isolation Valves are not replaced prior to SDC HX's replacement.

There is a risk that degraded Powerhouse Upper Level Service Water (PULSW) system isolation valves are not replaced prior to SDC HX replacements. The PULSW system isolation valves for HX1 (Pv11, Pv57) and HX2 (Pv12, Pv60) are in a degraded condition and require overhaul / replacement prior to the SDC HX Replacement. If the valves are not replaced during a PULSW outage prior to SDC HX replacement, then the project will likely be unable to isolate the HX's, and therefore the Project execution will have to be deferred until the isolation valves can be replaced. The use of ice plugs as an alternate means of isolation may also not be possible due to several limitations (will require the procurement of pipe freezing jackets for 16" diameter piping, a continuous supply of LN2 for the installation duration (30 days), a new fitter freezing penetration on the south side of the reactor (to enable ice plugging on PV11 pipe work inside containment) and minimal fluid flow in the pipe work (difficult with passing isolation).

<td>U2HX1 test isolation planned for 2016WW904 per 90-478136 and 4860198. Initial results were that isolation is acceptable on p/s and s/s. U2HX2 test isolation planned for 2016WW907 per 90-478137 and 4875153.</td>
<td></td>
</tr>
</tbody>
</table>

#### 318-31710 Incorrect Radiative Waste Characterization of the SDC HX's Delays Waste Disposal

Event: The assumed radioactive waste characterization of the SDC HX's (used to determine design requirements for shipping container) is incorrect.

Cause: Assumptions made in determining waste characterization prove incorrect, and radiological waste characterization is higher than expected based on initial expected contaminated penetration of the reactor. If a shipping container is designed and fabricated based on the incorrect characterization, then a new container will need to be designed and fabricated, which will significantly delay the removal of the old HX's from the Darlington site.

<td>16-31710 Stage Old HX so it doesn't impact installations</td>
<td></td>
</tr>
</tbody>
</table>

#### 318 Late Delivery of Long Lead Material (SDC HX's)

There is a risk that late delivery of long lead material will delay the start of installation. This risk is highest for the first HX, as the start of installation is very close to the completion of fabrication. For the remaining three HX's installed under this release, there is low risk of late delivery.

## Risk Report by Project with Associated Actions

### 31710 - Damage to Equipment & Materials

There is a risk that the HX and/or other equipment / material is damaged due to improper storage by vendor, poor handling during shipment/installation, or exposure to harsh environmental conditions.

<table>
<thead>
<tr>
<th>Action#</th>

<td>James Philips</td>
<td>31-May-16</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 31710 - Conflicts with other work being done inside the station

There is a risk that the installation timeline conflicts with other work being done inside the station. Work of higher priority may be in execution inside the station that will interfere with the project, be it conflict in resource allocation, use of space, or use of equipment. A key concern is with Refurbishment related activities, which may be scheduled to take place in parallel with this project.

<table>

<td></td>
</tr>
</tbody>
</table>

### 31710 - Additional Design to Address Increased HX Seismic Loads Delays Start of Installation

There is a risk that additional design to address increased HX seismic loads delays start of installation. Additional design is required to due errors in the original Combustion Engineering HX model and seismic analysis. Therefore the loads on the floor anchors are greater than initially designed for, and heat exchanger flexibility could result in unacceptable loads and fatigue failures in the piping system. Additional engineering may result in modifications to the HX, new piping supports in the field or extensive fatigue analysis, all of which could significantly delay the start of field installation. If significant, this could push the work into refurbishment.

### PULSW Piping Condition is unacceptable for welding to the new SDC HX Nozzles.

There is a risk that PULSW piping condition is unacceptable for welding to the new SDC HX nozzles. The PULSW piping at the HX tie-in points (shell side supply and discharge nozzles) is in a degraded condition due to microbiologically induced corrosion (MIC), and is approaching the minimum allowable wall thickness at certain pit locations. There is a risk that the piping is in such a degraded state, that it is unusable for welding to the nozzles on the new SDC HXs.

Risk Report by Project with Associated Actions

**4327** In Progress Work Plan Review by Environmental Compliance and ALARA

- **EPC vendor** to ensure all requirements outlined in the Environmental Impact Worksheet are captured in the installation work plans. Darlington Environmental Compliance work group will review all work plans before they are routed for approval. Coordinate closely with ALARA regarding the drying and transport of the HX's within the station (inside and outside). ALARA work group will review all work plans before they are routed for approval.

- **Ricardo Fiorini**

- **08-Apr-16**

- **Work plan review is in progress with sign-off expected by end of Feb 2016.**

**Heat Exchanger Unavailability**

- There is a risk that the Project cannot obtain permission from Reactor Safety and Operations to exceed the maximum amount of acceptable unavailability for SDC HX's per year (72 days per year per unit or 288 days per year per station (R-6)). The estimated time of each SDC HX's unavailability during replacement is 40 days, and therefore in a given year only 1 HX per unit could be replaced. This may prevent the SDC HX's from being replaced in order of age, with Unit 1, followed by Unit 2, followed by Unit 3 and finally Unit 4.

- **Active James Philips**

- **29-Apr-16**

- **Accept 24-Mar-16 2 1 3 6 2 1 2 6**

- **There are no Not Started, In Progress Actions associated with the risk.**

**Accessibility Issues**

- There is a risk that issues getting inside containment (access from MCR) or working inside containment (Breathing Air and Suit Communications system, Cooling System issues) cause delays to the execution work in the field and prolong the overall replacement duration.

- **Active Ricardo Fiorini**

- **29-Apr-16**

- **Accept 31-Mar-15 2 1 4 2 1 2 6**

**6E-31710 Design Quality**

- There is a risk that the EPC Vendor's Design Engineering Change (EC) Packages lack the necessary detail due to insufficient field walkdowns, or incorrect assumptions, thus leading to delays because of rework, or additional scope to address missed items.

- **Active Ricardo Fiorini**

- **29-Apr-16**

- **Mitigate 24-Mar-15 3 1 1 2 1 2 6**

- **Active James Philips**

- **29-Apr-16**

- **Accept 30-Jun-16 1 1 3 1 1 3**

**Unavailability of systems available for work in SDC rooms**

- Work Plan has pre-requisite steps to ensure Breathing Air and Suit Communication systems, and SDC Air Condition Systems are available for use prior to starting the work in the field.

- **Active Ricardo Fiorini**

- **30-Dec-16**

- **Third party review required for revised Design due to rework**

**OPG has provided the EPC Vendor with OPEX on Moderator HX drying and Dry Fuel Storage Container Vacuum Pump system. OPG Projects and ALARA have had several discussions with the EPC vendor regarding drying requirements.**

**Systems Available for Work in SDC**

- OPEX from Pickering for disposal/recycling, and, enable HX replacement due to rework.

- The ES MSA Contractor is to review OPEX from Pickering Moderator HX Recycling SCR N-2013-16015.

- OPG has provided the EPC Vendor with OPEX on Moderator HX drying and Dry Fuel Storage Container Vacuum Pump system.

- OPG has provided the EPC Vendor with OPEX on Moderator HX drying and Dry Fuel Storage Container Vacuum Pump system.

**Project: DNGS Projects - 31716**

**Risk of the production equipment failing testing and or commissioning due to the complexity in designing the amplifier boards - 31716**

- Based on Pickering OPEX and the complexity of designing the amplifier board, there is a risk that the delivered product might fail testing or commissioning. This can have an impact on the total cost of the project and lead to installation and or commissioning delays.

- **2 Active Rajbir Singh Basim Alawi**

- **12-May-16**

- **Accept 11-May-17 4 2 4 6**

- **There are no Not Started, In Progress Actions associated with the risk.**

**Risk of OPG design not having the Technical expertise to support the project - 31716**

- OPG Engineers providing design oversight might not recognize the limits of their technical expertise. This can cause significant rework and can impact the project schedule if milestones are delays and or missed.

- **2 Active Rajbir Singh Basim Alawi**

- **12-May-16**

- **Accept 10-Oct-16 4 1 4**

- **There are no Not Started, In Progress Actions associated with the risk.**

**Risk of the equipment failing testing and or commissioning due to the complexity in designing the amplifier boards - 31716**

- Since the amplifiers will be custom designed, their quality will not have been proven. There is a risk that the delivered product might fail testing or commissioning. This can have an impact on the total cost of the project and lead to installation and or commissioning delays.

- **1 Active Rajbir Singh Basim Alawi**

- **12-May-16**

- **Avida 01-Jul-19 3 4**
## Risk Report by Project with Associated Actions

### Action # 6152
**Status:** In Progress  
**Action Title:** Premature Failure - 31716  
**Action Description:** Since the amplifiers will be custom designed, their quality will not have been proven. There is a risk that premature failures occur. The consequences of premature failure could be spurious reactor trip or failure to trip during adverse conditions.  
**Owner:** Bassam Alawi  
**Delegated:** Bassam Alawi  
**Due Date:** 01-Jan-18  
**Comments:** There are no Not Started, In Progress Actions associated with the risk.

### Action # 6153
**Status:** In Progress  
**Action Title:** Introduce rigorous testing to mitigate equipment failure - 31716  
**Action Description:** To mitigate the risk of the production amplifier units from failing during commissioning, rigorous testing will be done at both the vendor facility and at the Darlington station to identify equipment failures before installing on channel.  
**Owner:** Bassam Alawi  
**Delegated:** Bassam Alawi  
**Due Date:** 29-Oct-17  
**Comments:** There are no Not Started, In Progress Actions associated with the risk.

### Project: DNGS Projects - 32202

<td>There are no Not Started, In Progress Actions associated with the risk.</td>
</tr>
<tr>
<td>32204 - Fukushima Phase II Risk of delay or cost increases due to scope definition/control</td>
<td>In Progress Project has significant risk of scope evolution stemming from: Ongoing evolution of OPG/Industry/CNSC approach to BOBE. Initial scope for this project consists of numerous modifications initially provided as solutions in a &quot;Fast track&quot; context, rather than a process. Use of Category 4 Modification process, with weaker definition of deliverables. Program is composed of numerous small modifications, integration issues with the overall response drive changes. Many aspects of BOBE response are new, outside normal practices or require &quot;extent of response&quot; decisions. Frequent scope change and clarification continues to occur in the design phase, contributing to cost and schedule delays. Project is part of a larger program for BOBE and SAM response, making it more difficult to control scope at a project level. Alignment with PNGS (for compatibility of equipment and consistency) often results in delay and sometimes scope as there are significant difference between the stations. The BOBE project structure is unique in having a support organization outside of projects which has sometimes scope as there are significant difference between the stations. Mitigating Response Guide procedures may cause delays and rework, impacting the final APS and summary for Fukushima modifications.</td>

### Risk Report by Project with Associated Actions

**33973.5**

- **Loss of Resources during Execution - 33973**
  - If there are major delays to the SG outage schedule the project could lose continuity in expertise and knowledge within OPG resources (primarily OTU, MTL, FTL roles). Plus, there is risk of losing continuity in control equipment vendor’s resources/expertise, which are critical for commissioning. Per experience from the first SG commissioning, Station resources are limited, and there is the risk of delay to commissioning if there are emergent issues. Due to the delay of 2nd SG Commissioning, the schedule is slipping into the approaching D1641 outage, which is resulting in potential loss of dedicated resources.

<td>31-May-16</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6443</td>
<td>In Progress</td>
<td>Float in installation schedule</td>
<td>This start of installation of the 2nd SG has been postponed by approximately 4 months to allow time for the resolution.</td>
<td>Rajbir Singh</td>
<td>31-Aug-16</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**33960.5**

- **Possible machine outage for SG during Commissioning - 33973**
  - Current SG4 machine status/condition - hydraulic start drive, internal gearing and bearing assemblies especially with the deteriorated condition of the front bearing/housing - deteriorated owing to the repeat start/stops cycle required as part of (controls system) commissioning. Thus the SG4 control system commissioning cannot be completed unless machine overhaul is done, impacting schedule.

<td></td>
<td></td>
</tr>
</tbody>
</table>

**33963.5**

- **Vulnerable SG Outage Schedule during Installation - 33973**
  - SG-outage schedule is vulnerable to emergent SG breakdown maintenance/repair. Such emergent issues could result in project delays in the order of months. There is also risk that major emergent issues could shuffle the order of execution of the remaining SGs controls replacements. During the current SG4 Commissioning, issues for the speed probe have risen.

<td></td>
<td></td>
</tr>
</tbody>
</table>

**33965.5**

- **Lack of Performance from EPC Vendor and possible multiple SG Outages during Execution - 33973**
  - There will be a learning curve for the EPC Contractor in providing engineering support for execution since they do not have OPEX from first SG. Darlington OP&P does not allow for more than one SG to be removed from service at any time. Forced outage of any SG during the installation or commissioning of this project will result in more than one SG outage, which may affect station operation.

<td>Salvaged Spares from previous SG replacements</td>
<td>Controls system components salvaged from the retrofitted SGs will be available as spares for the remaining SGs, thereby providing an interim bridging strategy until all SGs retrofits are completed in 2017. This may help in reducing the SG outage time.</td>
<td>Rajbir Singh</td>
<td>31-Mar-17</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**33967.5**

- **Emergent SG maintenance/repair issues arise.**
  - There is risk of emergent SG maintenance/repair issues, caused by deteriorating SG equipment. The result would be delay of the SG controls execution and project schedule, since one SG only can be removed from service at any time. There would also be cost impact through interest charges.

<td></td>
</tr>
</tbody>
</table>

**Action Planner**

- Rajbir Singh
- Lori Greenland

**Report Owner:** Lori Greenland

**Tech Tips**

- For delays greater than 6 months, the project will be placed in deferral status. Detailed designs have been completed for all of the remaining SGs. All design packages will be revised to incorporate the lessons learned from the first SG, allowing the flexibility to change the order of SG controls installations. The planning of the next SG will be integrated with the Station plan. This project schedule will minimize impact to VBO.

- For Internal Use Only

**Data Refreshed:** 2017-02-10, EB-2016-0152

---

Re-Filed: 2017-02-10, EB-2016-0152

Exhibit L, Tab 4.3, Schedule 1 Staff-073

Attachment 7, Page 68 of 235
Risk Report by Project with Associated Actions

**Gas Generator Vibration Readings Higher Than Expected**

Event: There is a risk that the gas generator (GG) vibration readings will be greater than the readings recorded prior to the modification (i.e. GG vibration operating margin to alarm/trip could be reduced).

Cause: The new monitoring equipment being more sensitive than the old equipment.

Impact: This could result in the new equipment being not accepted for service by stakeholders and/or delay to SS&G (2nd GG) return to service.

---

**Vendor expertise is not available during commissioning.**

Turbomachinery commissioning expertise (within controls vendor) is a scarce resource. There is a risk that vendor resources may not be available to support commissioning, caused by changes in the execution schedule. The result would be delay to commissioning and SS&G return to service.

---

**Inability to Lubricate SG Trunnions to Support Commissioning Tests**

Event: A recent SG trip event has required the SG trunnions (gas generator support structure) to be lubricated prior to each test run. There is a risk of not being able to lubricate the trunnions in time for each commissioning test as scheduled.

Cause: Mechanical Maintenance (MM) resources are not available when required to lubricate the trunnion. In ability to align the commissioning tests with MM resource availability.

Impact: Delay of individual commissioning tests, overall commissioning schedule and SS&G return to service (APS).

---

**Cost increases during Execution - 33973**

There is a risk that project cost will increase during the Execution phase through interest charges, inadequate vendor arrangements, and EPC Contractor under estimation. This financial increase may result from OPG initiated delays.

---

**Change of Market Rules Post Detailed Design - 33973**

Market rules have changed since the Standby Generators were last registered, and BEJU has requested changes to protection setting outside the scope of this project. There is a risk of cost increase and schedule delay.

---

**Project: DNGS Projects - 38419**

**Basis Analysis Discovery Issues**

EPC Contractor preliminary and detailed stress analysis exceed budgeted amount per performance fee quote and BCS due to discovery issues.

---

**EPC Qualified Stress Analysts Resources Limited**

Lack of qualified OPG resources to support acceptance of Stress Analysis Reports from EPC Contractor in a timely manner due to emergent work, and/or qualified resource limitations.

---

**Design Discovery Issues**

Additional Scope to Preliminary Design, Detailed Design, and/or Stress Analysis with EPC Contractor is required due to discovery issues.

---

#### Regulatory Risk - CNSC and/or TSSA approvals delays

- The Project will ensure CNSC and/or TSSA approval for the modification may take longer than expected resulting in a cost/schedule impact.
- The impact is increased cost and schedule.

#### excavation risks

- Excavation is required for the tie in of the new sewage line to the outside existing asbestos line.
- The risk that could be encountered during excavation are as follows:
  1. discovery of documented and undocumented buried services
  2. discovery of undocumented items
  3. requirement for dewatering
  4. poor soil conditions
  5. lack of availability of excavation equipment
  6. lack of station space to store excavated soil
  7. potentially contaminated soil causing difficulty with disposal

The result of these risks being realised are an increase in schedule duration and an increase in cost.

#### Project: 38466 CSA Sewage Lift Station - Project - Design - Existing Electric Pumps (P11/P22)

- There is a risk that the existing electrical pumps (P11/P22) will not be capable of pumping out the sewage through the new line due to its extended length. It may also require changing the configuration, power supply, and the control system including modification of the electrical panel.
- The impact is increased cost and schedule.

- To manage this risk, stakeholder involvement and review of installation area and resources are being engaged during the design phase.

- The Project - Weather delays

- In order to use the proposed new route: calculation, clearing interferences, and adding supplementary steel for the needed supports in addition to a number of approvals from the station are required.
- The Project - Approval of the proposed route

- To manage this risk, stakeholder involvement and approvals will be obtained as detailed design progresses.

- The Project - Weather delays

- Inspection of the asbestos sewer line (0-79120-L68-W6ACC) from 2006 found only minor spot repairs were required. Since asbestos sewer line is expected to last 70 years, there isn’t a large concern that major repairs would be required.
- An inspection in the future would be beneficial in identifying if any other spot repairs are required on the line. The risk for not inspecting the line is that the line of the construction will be unknowable and even though there is a new sewage line (0-79120-L7-96A) inside the powerhouse, the asbestos line, 0-79120-L68-W6ACC, may also need major repair and would lead to leakage or clogging the line.

- The Project - Source of Clean Water

- There is a risk that clean water cannot be provided to clean the temporary tank, temporary piping, and the main sewage sump (i.e. type of water, source of water). The impact is delays in the work leading to cost increase.

- Time to reach the best possible level of water quality during excavation is critical.

- Stakeholders are being engaged during the design phase.

- The Project - Availability of Sanitary Trucks

- There is a risk that the winter weather could cause delays to the schedule if it is too cold to pump sewage and/or excavate. The impact of the severe weather is delay to schedule which would cause increased costs to maintain resources.

### Action

- There are no Not Started, In Progress Actions associated with this risk.

- There are no Not Started, In Progress Actions associated with this risk.

- There are no Not Started, In Progress Actions associated with this risk.

There is a risk to the completion of the design for PRV 196 as the new PT envelope has not been defined yet which is providing some uncertainty on what the specific design requirements will be. The design will be progressed but not approved until the PT envelope is approved through a challenge meeting. Station will determine the new PT envelope based on the latest fracture toughness curve at 120 ppm. Project manager will be a part of the working level meeting to provide input on the constraints and issues and monitor the impacts to the project related work. This risk will be monitored and any project impacts/ additional modifications will either create a new project or require a superseding BCS for the additional scope.

Risk Report by Project with Associated Actions

**Project: DNGS Projects - 80151**

**Detector Location may be Inaccessible During Installation - 80151**

- **Event:** There is risk designated detector locations are not accessible during installation. Cause: The location of detectors is uncertain at this stage. This will be identified at the Detail Design of the Project.
- **Impact:** Uncertainty of the location of detectors may cause underestimation of budget of installation.

**Possible Issues and Risks**

- **Availability of Resources**
  - Event: There is a risk of resource availability during the overall project.
  - Cause: Due to multiple areas included in the Scope of Work, multiple disciplines will be required to commence the work. Complexity of Project has potential risk for the availability of resources.
  - Impact: Unavailability of resources may delay the project.

- **Project Cost as Budgetary Constraint**
  - Event: There is a risk that costs will exceed the estimate.
  - Cause: Estimated cost is based on stakeholders’ inputs. Budgetary quotes are not available at this early stage of project.
  - Impact: Increase the estimated cost of the project.

- **Inadequate Detector Capability for the Hazard/location - 80151**
  - Event: There is a risk that selected detection technology is inadequate for the hazard / location being detected.
  - Cause: The selected detectors required to be compatible with the existing system of the plant which will be assessed during the detail design phase.
  - Impact: Work/reassessment for the compatible technology of detectors can lead to increase cost of Project.

### Project: DNGS Projects - 80062

There is a risk that the vendor will change the battery manufacturing process.

If battery manufacturer changes the manufacturing process, they may not support the batteries specifically designed for OPG. Vendor is preparing to switch their manufacturing process for cell plates from vertical pour to side pour, they have found this process to be more efficient with better quality. If vendor does support the OPG specific batteries there will be additional costs for them to produce additional cell plate molds. The vendor recommends OPG switch to the standard batteries used in all other nuclear applications. The difference is between a single point plate suspension design (standard) or a 2 point plate suspension design (OPG).

</table>

### Project: DNGS Projects - 80150

There is a risk that once detailed design, materials and execution are further defined, the scope of work will change and the cost will increase.

There is a risk that missing outage planning milestones could jeopardize the ability to perform the work in the desired outages. Missing an outage would delay the entire project.

Risk Report by Project with Associated Actions

Project: DNGS Projects - 31512

16-31522 DMS Electrolyzer: There is a risk that there will be insufficient funds to close out the project due to commissioning issues. The project encountered numerous issues during commissioning which extended the duration of the project and increased project costs substantially. Due to this, the project is accepting a PCRAF to access contingency to fund the remainder of the project.

Action# Status Action Title Action Description Owner Delegate Due Date Comments
6071 In Progress Process all CTPs and PCAs expeditiously if acceptable There is a risk that the sub-contracted design agency will not have sufficient funds to support the project. This action will ensure that money is not held back where it is deserved. The action is to process all CTPs and PCAs expeditiously to ensure the sub-contractor will continue work. This will be a continuous action through APS and into design closeout phase. Francis Davis Ayman Abdalla 30-Jun-16

In Progress 80023 - Assess LCV Valve Body Condition

There is a risk that manufacturing issues could result in valve sizes that don’t fit leading to schedule delays and cost increases. EVENT: The valve sizes are manufactured incorrectly. CAUSE: Poorly Procured or designed valves IMPACT: cost and schedule delays and cost increases.

The extent of software validation testing may increase based on the outcome of the software design, due to potential additions to the source code and number of programs that require rebuild, resulting in engineering cost increase.

Future plant modifications with impact on control computers may need to be included in the current scope of software change when they are identified, resulting in design cost increase.

There are no Not Started, In Progress Actions associated with the risk.

Project: Engineering Services (Project) - 82825

The extent of software validation testing may increase based on the outcome of the software design, due to potential additions to the source code and number of programs that require rebuild, resulting in engineering cost increase.

There are no Not Started, In Progress Actions associated with the risk.

Project: Extended Operations -

Issue: Pickering NSG Units 6, 7, 8 Cobalt Adjuster Rod irradiation Limit is 2.2 FPy. CNSC approval will be required to increase this irradiation limit to support a 30 month (2.5 year) outage interval on these rods.

There are no Not Started, In Progress Actions associated with the risk.

Page 1 of 1
**Risk Report by Project with Associated Actions**

**Trophy Refurbishment scope execution impacts Powertrack [Windows 39, 47, 52]**

- Event: Station staff schedules Trophy refurb work (also performed in the FFAA's) to the work windows designated for Power Track refurbishment adding additional staff to an already tight work environment.
- Cause: As per the Blue Ribbon initiative Trophy refurb work been grouped with Power track Refurb.
- Impact: Both cost and schedule would be impacted if this were to occur as there could be a coordination/delay issues.

**Discovery Work on Power Track Execution [Windows 39, 47, 52]**

- Event: Discovery Issue during Power Track Execution
  - Field discovery issues such as configuration management or equipment degradation.
  - Impact: Execution delay to resolve configuration or equipment conditions

**Power Track ES MSA Staffing Agreement Impact Execution Costs [Windows 39, 47, 52]**

- Event: ES MSA contractor is unable to re-assign Power Track staff to other active projects during standby periods of the execution schedule.
- Cause: Each Power Track execution is made up of 17 work windows ranging from 4 to 28 days spread out over 6 months. In between each work window some staff may be able to work on preparation for the next window or may be reassigned to other projects, staff that cannot be doing prep work or be re-assigned will need to be paid standby time.
- Impact: Additional cost for standby time pay that the project will be responsible for.

**Breathing Air modification does not fully mitigate requirements during Execution [Windows 39, 47, 52]**

- Event: Both Contractor team and Fuel Handling Maintenance and/or station staff working in Fueling duct at the same time puts a significant load on the breathing air system.
- Cause: Trolley reliability failure occurs with Power Track execution causing both teams to be forced to work in the Fueling Ducts simultaneously.
- Impact: Cost and schedule may be impacted if Breathing Air cannot support both activities simultaneously thereby increasing the amount of standby time the project must pay for Contractor staff.

**Powertrack Engineering Support During Execution [Windows 39, 47, 52]**

- Event: Engineering support is required during execution, examples: To modify Power Track frame, scaffolding, or other possible necessary modifications discovered during execution.
- Cause: Power Track contract is Procurement and Construction, as the project is "Like for Like", Therefore any Engineering support required would likely be provided by OPG engineering and not covered under current contract baseline.
- Impact: If this is realized OPG engineering support will be required, impacting cost and schedule.

---

</tbody>
</table>

### Identification of Tooling requiring Modifications to Station (Window 39, 47, 52)

Event: Engineering support is required during work planning to verify design of an anchor point, addition of shives, or other modification to station identified prior to execution to perform Power Track replacement. Cause: Power Track contract is only Procurement and Construction, as the project is “like for like”. Modifications may require to be safely install tooling needed to perform replacement. Impact: Unplanned costs due to engineering support would be required.

<td>Sorin Marinescu</td>
<td>Greg Maggs</td>
<td>31-May-17</td>
</tr>
</tbody>
</table>

### Project: Minor Modifications - 83061

#### Water Dissolved Oxygen

Event: Software qualification of one or more components or group of components is required for the successful implementation of this modification. Cause: Due to the low chemical addition rates required for alkalization of the stator cooling water the metering pump to be used may have a PLC or other software. Impact: Software qualification would extend the implementation schedule by several months. Estimated at 6 months.

<table>

In Progress Alkalization tie-in point availability to the LP FWHX procurement

Technical Specification for system tie-in point

Reduction - Alkalization

Water Dissolved Oxygen

83061 - PNGS Stator Cooling

Impact:
Reduction - Construction

Water Dissolved Oxygen

83061 - PNGS Stator Cooling

schedule risk

Implementation of any required work during outage, for example on the stator cooling head tank, is to be completed during the next available outage. Preferred outage is 1671. This does not meet the required milestone dates as per N-PROC-MA-0013 R16, in particular milestone 10 - Scope Freeze. Cause: There is a short timeline between request for the modification (February 2016) and expected implementation (Q4 2016 to Q1 2017). Impact: Outage scheduling is prepared to minimize nuclear safety risk, maintenance windows, and permit applications. Late scope additions require re-review of several of these considerations.

Impact:

Reduction - Chemistry

Water Dissolved Oxygen

83061 - PNGS Stator Cooling

Testing funding availability

Implementation of stator cooling water sparging is likely to have some installation scope requiring outage, 1671 outage scope freeze milestone has passed, and any new scope must be progressed using a scope change form. This action is to socialize the additional scope with the 1671 turbine SWC prior to formal scope change and then to track the scope change to implementation upon detailed design approval.

Impact:

Attachment 7, Page 85 of 235

Event: The business case summary (BCS) for project 83061 - Implementation of Polvering 018 Stator Cooling Water (SCW) alkalinization and make-up water demineralisation has not yet been approved despite the need for this modification to be implemented in later 2016 to early 2017. Cause: There are no funds available to support execution of this project until the BCS is approved.

Event:
The modification may require custom fabricated materials, such as a double walled chemical storage tank. Cause: There is a short timeline between request for the modification (February 2016) and expected implementation (Q4 2016 to Q1 2017). Impact: Such custom fabrications may have a long lead time. Potential impact to schedule is 4-5 months.

Event: 4-4240/V0206 cannot be used, either by modification with a Tee or other means such as TMOD or TALT, to allow for alkalinization when required and/or online chemical cleaning when required. Cause: The proposed tie-in point 4-4240/V0206 for the stator cooling alkalinization system is also used for online chemical cleaning. Impact: The addition of a new injection point into the stator cooling water system will increase the cost and schedule of this modification. The extent of the impact will depend on finding a new location for injection.

Training: Minor Modifications - 82839

Run by: For Internal Use Only Page 1 of 1
Risk Report by Project with Associated Actions

Project: Minor Modifications - 80130

Event: Design Packages
- Completion of Design Packages: Event - Design Packages may not be available as scheduled. Cause - Design resources not assigned. Impact - Delay in overall schedule and completion of modification.

Event: Delay in Schedule due to increase in scope
- Discovery during detailed design for unknown assumptions in preliminary design. Impact: The schedule may be delayed by 3-6 months.

Project: Minor Modifications - 83056

Event: Convoyor Stop Cylinder Replacements: Funding availability
- Event: There is no funding approved to start work. Cause: Project is recently included on 2016 Project Start List. Event: Delay to project until ICS approval will cause an overall delay to the whole Modification.

Event: Convoyor Stop Cylinder Replacements: Work Protection is available
- Event: Confirm if Work Protection is available to install the modification. Cause: Work Protection shall be available to provide an isolation in the convoyor tube. Impact: To avoid any delay during installations and commissioning.

Event: Convoyor Stop Cylinder Replacements: Installation of isolation device is feasible
- Event: Isolation device is feasible to install. Cause: Isolation device must be safely installed to support the modification. Impact: Delay to the project execution.

Project: Nuclear Waste Management (Project) - 60162

Event: Contractual AFS date delayed
- Contractual AFS date in Feb 23, 2017. All change notices processed to date did not adjust the AFS date, however, current production schedule is showing April 2017 AFS. This is a result of delays in completing the building foundation and a longer than expected structural steel erection window.

Event: MPS risk due to delays in Contractual AFS date
- The Safety Report / Safety Report Annex update and other supporting documentation, which is part of the licensing requirements need to be submitted and accepted by the CNSC before the in-service date, however, current production schedule is showing April 2017 AFS. This is a result of delays in completing the building foundation and a longer than expected structural steel erection window.

<td>30-Jun-16</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Lack of Vendor equipment data

Lack of Vendor equipment data will result in numerous gaps in the design package and potentially delay design completion.

<table>
<thead>
<tr>

<td>Bianca Radakovic</td>
<td>31-May-16</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Environmental Regulatory Delays

MOE/ Municipal approvals may take up to 2 years, delaying start of installation. Pre-existing PBs site issues postponing discussions with regulatory bodies. There are also poorly defined design requirements.

<table>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Building Collapse Study

Collapse of concrete shielding may compromise dry storage container integrity in a design basis accident. Design may require several iterations to ensure DSC is not compromised during a building collapse.

<table>
<thead>
<tr>
<th>Action#</th>
<th>Status</th>
<th>Action Title</th>
<th>Action Description</th>
<th>Owner</th>

<td>Bianca Radakovic</td>
<td>31-May-16</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### PB Cancellation resulting in SB4 Design/Licence Re-work

There is a risk due to plant life extension the the PB scope will be delayed or cancelled. This will result in cost/schedule impact due to contract revisions. Design drawings would require revisions and licensing documents would have to be changed to include only SB4, which put the licensing submission timeline at risk.

<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Storage Building Shielding

There is risk that the storage building will be required to be shielded heavily and constructed as a concrete bunker. Requiring design re-work and increasing project cost significantly. The cause of this risk is due to shielding analysis acceptance/requirements see risk ID: 000003017. Building concrete bunkers will have additional engineering/Detailed design rework and construction cost.

### EPC Costs Greater than Estimated in Release

There is a risk that EPC estimates are greater than the amount estimated in the release. This may be due to underestimation and/or mismanagement of project funds; consequently the project progress is impacted.

- **Action**: In Progress
- **Title**: Detailed Field Walkdowns
- **Description**: Perform detailed field walkdown with contractor and subcontractors to verify design drawings and field conditions match.
- **Owner**: Julie Lawrence
- **Due Date**: 21-Jun-16

#### Comments
- **Oncore reports shows increased spend causing concern of deliverables vs spend.**
- **New DSP commenced design and removed DSP costs not settled to date.**
- **Vendor progress is struggling to maintain schedule.**
- **Walkdown of Lime system identified configuration mgmt issue N-2016-08211.**
- **Walkdown of spray cooler elbow identified configuration mgmt issue N-2015-23669.**

### Inaccurate Labour Cost Estimates

There is a risk that inaccuracies in labour cost estimates (e.g. over-optimistic execution schedule) will lead to construction costs being higher than estimated.

- **Action**: In Progress
- **Title**: Weekly Monitoring of Actual Costs
- **Description**: Actual costs to be monitored on a weekly basis while ensuring deliverables are being completed.
- **Owner**: Julie Lawrence
- **Due Date**: 15-Sep-17

#### Comments
- **ES Fox is currently in the process of reviewing their proposal from April 2015 and will be submitting a revised estimate.**

### Legacy Issues with Existing Equipment Tie-ins

There is a risk that legacy issues with existing equipment tie-ins may result in field changes.

- **Action**: In Progress
- **Title**: ES MSA Vendor Progress per Schedule Monitored
- **Description**: ES MSA vendor progress per their schedule is monitored closely to ensure OPG is getting value for the money.
- **Owner**: Julie Lawrence
- **Due Date**: 15-Sep-17

#### Comments
- **Vendor progress is struggling to maintain schedule.**
- **Walkdown of Lime system identified configuration mgmt issue N-2016-08211.**
- **Walkdown of spray cooler elbow identified configuration mgmt issue N-2015-23669.**

### Design Resources Unavailability

There is a risk that design resources could be diverted from this project to higher priority projects resulting in schedule delays.

- **Action**: In Progress
- **Title**: Design Review Meetings
- **Description**: DTL and Project Lead to discuss resource issues. Issues should be escalated when swift resolution is not met.
- **Owner**: Julie Lawrence
- **Due Date**: 15-Sep-16

#### Comments
- **Specifications are in process of being submitted by DSP. All tech specs should be accepted by OPG by end of May.**

### Long Lead Time Items Procurement Delay

There is a risk that delay in procurement of long lead time items due to inability to complete design phase may result in schedule delays.

- **Action**: In Progress
- **Title**: Early Identification and Cost Estimation of Long Lead Items
- **Description**: Instruct contractor to identify and cost estimate any long lead items early in design review.
- **Owner**: Julie Lawrence
- **Due Date**: 30-Jun-16

#### Comments
- **Specifications are in process of being submitted by DSP. All tech specs should be accepted by OPG by end of May.**

### Construction Errors Leading to Delays

There is a risk that construction errors lead to schedule delays.

- **Action**: In Progress
- **Title**: Review of Detailed Designs
- **Description**: Review detailed designs to ensure MDR requirements are met and vendor is not providing more than the DR requires.
- **Owner**: Julie Lawrence
- **Due Date**: 21-Jun-16

#### Comments
- **Walkdown of Lime system identified configuration mgmt issue N-2016-08211.**
- **Walkdown of spray cooler elbow identified configuration mgmt issue N-2015-23669.**

Project: Nuclear Waste Management (Project) - 60218

Delay in Closeout of POs 229048 and 229265 due to outstanding Payouts and Rate Settlements

There is a risk that the closeout of PO 229048 and 229265 is delayed due to Performance Fee payouts, the outstanding rate increase, and PRT (project management) rates being negotiated between OPG Supply Chain and the vendors, Black & McDonald and ROM Technologies.

Action:
- 6695: In Progress, Follow Up with Supply Chain
  - Owner: Sharon Maddock
  - Status: In Progress
  - Action Title: Follow Up with Supply Chain
  - Action Description: OPG Supply Chain to complete settlement of payouts and rates which will allow for ES MSA POs to be closed. Follow up with Supply Chain on the status of this.
  - Owner: Sharon Maddock
  - Delegate: Steven Sahakian
  - Status: 30-Sep-15
  - Comments: COMPLETED (09-Sep-15): Followed up with Supply Chain. They are in the last stages of settling these payouts and rates and will follow up with Projects upon completion. Now depends on EPSCA unions posting their rates. Action to close once POs can be closed.

Project: Nuclear Waste Management (Project) - 60219

Delay in Closeout of PO 228027 due to Outstanding Scope Addition Work

There is a risk that the closeout of PO 228027 is delayed due to outstanding WFTOSF Room 129 Overpressurization work, included as a scope addition to this PO, documented by PCA: PO-228027-2014-002. Installation of the louver, damper, and actuator is completed but software changes and tie-in to the HUND system still remain.

Action:
- 5794: In Progress, Communicate with Project Lead and Vendor
  - Owner: Sharon Maddock
  - Status: In Progress
  - Action Title: Communicate with Project Lead and Vendor
  - Action Description: Communicate with the Project Lead and vendor on this status of this work to ensure it will be completed.
  - Owner: Sharon Maddock
  - Delegate: Steven Sahakian
  - Status: 29-Jul-16
  - Comments: New PO line item to be issued to transfer work to project 60145 by 29 July 2016. This will remove all risk associated with this project.

Project: Nuclear Waste Management (Project) - 80032

Rending Changes (EC 118441) could impact Software EC Completion

The changes from the reconfiguring the Generator Control Logic (as part of EC 118441) is expected to be complete by mid May 2016. However, the Software Qualification (EC112396) for this project is to be completed by August 30, following the Software Integration Testing. The current timelines for integrating the 2 ECs has the potential to delay Engineering completion, and also result in a work rework for completing the Software EC.

Action:
- 7005: In Progress, Complete Software for EC118441
  - Owner: Sharon Maddock
  - Status: In Progress
  - Action Title: Complete Software for EC118441
  - Action Description: Complete software portion of EC118441 - Generator Control Logic.
  - Owner: Sharon Maddock
  - Delegate: Lashan Munasinghe
  - Status: 29-Jul-16
  - Comments: In progress

Impact of this BMS modification on interfacings with Data Handling System has not been verified

The communication protocol between the New BMS and the Data Handling System has not been confirmed. If this design is not confirmed the alarms from the BMS may not be available at the Data Handling System.

Action:
- 6679: In Progress, Develop Test Bed to confirm communication protocol between BMS and Data Handling System
  - Owner: David Calkin
  - Status: In Progress
  - Action Title: Develop Test Bed to confirm communication protocol between BMS and Data Handling System
  - Action Description: For Sub-contractor to develop test bed to confirm the communication protocol between BMS and Data Handling System.
  - Owner: David Calkin
  - Delegate: Rajkumar Ramaswamy
  - Status: 30-Jun-16
  - Comments:

EPC Contract cost could increase due to quality of the estimate.

This EPC estimate is a Performance Fee proposal. Inadequate scope control could result in scope/cost growth.

Action:
- 6679: In Progress, Develop Test Bed to confirm communication protocol between BMS and Data Handling System
  - Owner: David Calkin
  - Status: In Progress
  - Action Title: Develop Test Bed to confirm communication protocol between BMS and Data Handling System
  - Action Description: For Sub-contractor to develop test bed to confirm the communication protocol between BMS and Data Handling System.
  - Owner: David Calkin
  - Delegate: Rajkumar Ramaswamy
  - Status: 30-Jun-16
  - Comments:
In Progress Conduct bi-weekly verification of the design work progress. Provide adequate project oversight to manage cost growth. Schedule regular bi-weekly progress meetings and review design deliverables.

David Calkin 
Rajkumar Ramassamy 
30-Aug-16
Weekly project review meetings are scheduled for a set of standard agenda items, to monitor the earned value. All Engineering deliverables are milestone based, and hence the risk is low. However, the OPG Project/Engineering staff will be at the Engineering Contractors site to physically review the the progress, and ensure OPG receives value for money. The Engineering contractor will also upload all deliverables (monthly basis) to a SharePoint site, to enable OPG monitor the design progress.

There is a risk that Wraparound Engineering (ECC Transitioning to Nuclear ECC) will be delayed due to outstanding design documents. The initial screening has indicated that the software needs to be Cat 2. The Building Management System (BMS) communicates alarms to the WVRB Control Room, for operator action during evenings and weekends, when the Processing Building is unmanned. The WVRB Control Room is designated as Cat 2. The BMS is primarily designated Cat 2, only because it is providing input to the Cat Software (WVRB). Currently the Incinerator Upgrades project is working on reducing the Cat 2 designation of the WVRB software. This would imply that the BMS software categorization could also be lowered. Additionally, no adequate Software System Requirements/Design Description documentation is available.

Risk Report by Project with Associated Actions

**E4-4076 - FT Outage Work Access Issues - Schedule and Cost impacts**

The design solution was made as per the solution in Pickering A unit 1 & 4, which are working. However, the solution is not working after the modification was installed in Unit 6. The installation of 90 degree rotation mod is to be re-scheduled in IOP once the correct design solution is in place.

</tr>
</tbody>
</table>

**E4-4076 - FT Mod: FT MAC Valves - No Fuel Window Availability**

Installation of this mod requires no fuel windows on the respective unit. Therefore, the status of the unit and its fuelling requirements may cause delay to schedule and carrying costs to the project. Due to materials issue as per SCR N-2016-06776, new installation no fuel windows are required.

</tbody>
</table>

**E4-4076 - FT Mod: FT MAC Valves - Materials Availability & FT MAC Valves - No Fuel Window Concurrence**

The delivery, receive/inspection and staging of transition plates may be delayed due to CAT-ID health issue (Q level not aligned with DNGS and flagged incorrectly as non pressure boundary). Expiration of TSSA registration and existing inventory are defected and do not fit. Reference SCR: N-2016-06776. As a result of this risk, the delivery of the materials in time for installation is at risk.

## Project: PNGS Projects - 40974

**13-40974 Cost Risk - Estimate Quality**

This project will be executed as two phases: 
- Cost of Phase 1, wireless pendant addition - in execution phase and within budget / estimate. The scope and budget were defined through PCA process. 
- Cost of Phase 2, critical parts, is only a Class IV estimate based on a conceptual design report and as a result actual costs may be more...

<td></td>
</tr>
</tbody>
</table>

**13-40974 IFB Crane Schedule and Cost Risks - Limited Design Resources**

Internal design resources are not readily available to commence preliminary engineering work for new AIFB and IFB-A scope (Phase 2 - critical parts). This will impact project schedule and if resources need to be contracted out, this will result in schedule and costs increases.

</tr>
</tbody>
</table>

## Project: PNGS Projects - 40987

**13-40987 - Superficial replacement - cost and schedule impact**

Revision to the technical requirements may result in increased costs and schedule. There is a risk that the superficial will not operate per technical requirements resulting in re-work and delays.

</tbody>
</table>

## Project: PNGS Projects - 41024

**Scope - Changes**

Scope is based on assessments done in the conceptual design phase. Extent of engineering activities, number of spares required, and scope of sample installations may change as it is not defined in this project charter. This will impact project cost and schedule.

## Risk Report by Project with Associated Actions

### Installation Schedule Changes
Current schedule assumes sample installation work will take place in other IOP or Unit outages. This could change if the station directs the project to do some installation work in IOP or in other Unit outages than planned.

<table>
<thead>
<tr>

<td>Project team will clearly delineate expectations and quality of deliverables to contractor and OPG Site support staff. Review experience and past references of similar projects completed in the past.</td>
<td>Addi Bhardwaj</td>
<td></td>
<td>30-Jun-16</td>
<td></td>
</tr>
</tbody>
</table>

### Design Schedule Changes
Various stakeholders (Projects Design, Plant Design, Reactor Safety, Maintenance, and others) are involved in review of the engineering deliverables which could impact the schedule if certain stakeholders do not provide timely feedback.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

### Performance of replacement SD51 isolation amplifiers
There is a risk that the replacement components may not fit/function as expected as they have been reverse engineered and have a different connector than the old isolation amplifier. This would require rework/testing which would impact cost and schedule.

<table>
<thead>
<tr>

</tbody>
</table>

### Project: PNGS Projects - 41027

**6929/815158/41027 - Risk of additional scope to ensure functionality of BDBE modifications (BCS)**
This EPC vendor will perform a functionality assessment study to ensure all of the project modifications will function following a BDBE. If the EPC vendor assessment identifies a gap in functionality post BDBE which requires additional scope to close, it will result in increased cost and schedule for the projects, possibly putting the CNO milestone to complete Fukushima action items by 2017 at risk.

As a result of functionality assessments (including SMAs) being done to ensure mod installed/planned will function post BDBE, gaps may be identified that need to be addressed, leading to additional scope to implement solutions.

| 6920    | In Progress | 49299/49158/41027 - Manage Schedule Changes due to Outage | Use OPEX from previous outage delays to ensure adequate resources to support approved outage schedule. Ensure adequate funding to execute work with contingency for limited delays. Inform OCC Manager, Outage Section Manager, Outage Manager and Project Sponsor of any delays. 
- attend weekly outage meetings and stability of slated installation windows on outage schedule 
- re-allocate resources in response to outage window changes to minimize cost and time impacts. 
- communicate and escalate key management personnel unresolved outage scheduling issues | Cleve Desouza | | 3-Dec-17 |  |
| 6926/49158/41027 - INADEQUATE SCOPE DEFINITION MAY CAUSE INACCURATE ESTIMATES (RCS) | As a result of inadequate definition and understanding of scope/requirements may cause adverse contract cost and time to complete modification. | 3 | Active | Cleve Desouza | | 02-May-16 | Mitigate 08-Jul-16 3 2 3 2 1 2 4 |
| 6929/49158/41027 - ADVANCE WORK WHILE DESIGN IS COMPLETED | Pre-requisite work planning and procurement activities to be advanced with 90% design input. This will allow work to progress instead of delaying due to design completion. This will be done, while challenging Design to meet committed due date. | 2 | Active | Cleve Desouza | | 31-Aug-16 | 2 2 3 1 2 4 6 |
| 6927 - Potential Late Completion of EPR Design | As a result of the potential late completion of the Emergency Power Restoration (EPR) design, downstream procurement and construction milestones may slip. | 2 | Active | Cleve Desouza | | 10-May-16 | Mitigate 31-Aug-16 2 2 3 1 2 4 6 |
| 6929/49158/41027 - USC CAN exchange rate retrofit for contract due to currency exchange difference | There is a risk of cost increase as a result of the exchange rate difference between the Canadian Dollar and the US Dollar (USD), which may lead to higher cost on the PO. | 2 | Active | Cleve Desouza | | 02-May-16 | Accept 08-Jan-17 4 1 4 1 1 4 6 |
| 6929/49158/41027 - Availability of Resources (RCS) | As a result of a high volume of deliverables and station priorities, receiving sufficient OPG station resources may be challenging, leading to an impact in schedule and cost. | 2 | Active | Cleve Desouza | | 10-May-16 | Monitor 06-Oct-16 2 2 2 2 2 4 6 |

**Action Titles:**

- **Mitigate:** Addressing and managing risks.
- **Accept:** Risk accepted as it is.
- **Monitor:** Monitoring the risk to determine future actions.
- **Re-allocate:** Reallocation of resources.
- **Communicate:** Communication of risk to appropriate personnel.
- **Escalate:** Escalation of risk to higher levels.
- **Advise OCC:** Advising OCC of the risk.

**Comments:**

- With EPR (including DG Storage) detail design nearly complete, better understanding the design elements lead to increase estimate. Impact on the cost is in the order of $6M. Full scale testing is also being undertaken to further confirm hydraulic capability of the EME pump network. PCRFA is being prepared.

**Risk Report by Project with Associated Actions**

**BBEB modifications (BCS)**

Schedule for the projects, possibly putting the ONG milestone to complete Fukushima action items by 2017 at risk.

As a result of functionality assessments (including SMAs) being done to ensure mod. installed/planned will function post BBEB, gaps may be identified that need to be addressed, leading to additional scope to implement solutions.

**BBEB modifications (BCS)**

As a result of unforeseen outage work program delays, resources or installation windows may become unavailable, which could impede our ability to meet outage related milestones and incurred unforeseen cost.

**INACCURATE ESTIMATES**

Due to the existence of at least 2 utility cables (including the main fibre-optic networking cable connecting the 777 Brock Rd. location to the main plant) running beneath the planned construction, there is a risk that the construction could be delayed by the relocation and retermination of these cables/utilities.

**BBEB modifications (BCS)**

As a result of inadequate definition and understanding of scope/requirements may cause adverse contract cost and time to complete modification.

**INACCURATE ESTIMATES**

Due to the fact that the procurement of pressure boundary qualified Storz fittings may take longer than initially expected, there is some risk that the installation and AFS of the NV18/V16 modifications may be delayed. The original schedule was based on a material delivery date of May-June, at this time the last items required to be delivered are expected to be delivered sometime between May and August. If these items are delivered after these dates, it could potentially impact the schedule for the projects, possibly putting the CNO milestone to complete Fukushima action items by 2017 at risk.

**DATA**

Prepare a plan in order to perform additional work to investigate the buried cables. Scanning and excavation will be performed. This action will continue over the entire duration of the work package and will be status dated monthly.

Due to the existence of at least 2 utility cables (including the main fibre-optic networking cable connecting the 777 Brock Rd. location to the main plant) running beneath the planned construction, there is a risk that the construction could be delayed by the relocation and retermination of these cables/utilities.

<td>In Progress</td>
<td>49299/49158/41027 - Manage Availability of Resources</td>
<td>OPQ Projects will challenge the EPC vendor to work with station work management to avoid conflict with station schedule and resource planning. OPQ Projects will also ensure that the EPC schedule utilizes staggered reviews, where possible, to minimize OPQ work group resource requirements. Routinely monitor resource balance and challenge project team (including EPC) vendor to plan work with consideration for minimizing resources conflict or identify if risk is imminent.</td>
<td>Cleve Desouza</td>
<td></td>
<td>06-Oct-16</td>
<td></td>
</tr>
</tbody>
</table>

### Availability of Resources (BCS)
- As a result of a high volume of deliverables and station priorities, receiving sufficient OPQ station resources may be challenging, leading to an impact in schedule and cost.

### Changes to cost of modifications (BCS)
- As a result to the potential refinement of industry, regulatory, and station approach, as well as incomplete modification packages at the time of estimation, there may changes to the cost of the modifications.

### Changes to IOP Work Being Removed from Scope
- As a result of the fact that there is a good deal of upcoming IOP work and that this work is scheduled differently from outage work, there is a risk that Fukushima-related IOP work may be ranked as low-priority and removed from IOP scope.

### Change of Sub-Vendors with SRE and Work Week Leader
- As a result of contractor considering new sub vendor for engineering and close-out support, there may be a potential for improper hand-off, misrepresentation and understanding of scope, which if occurs may lead to undesirable impact on cost and schedule.

### Vendor Quality Issues (BCS)
- As a result of vendor quality, modifications may not be accepted, leading to increased cost and delays.

### Changes to EME deployment time (BCS)
- There is a risk that following the Probabilistic Risk Assessment (PRA) reviews, new requirements for deployment time of EME equipment will be identified, leading to a potential impact on the design of the modifications and or scope.

### Notes
- There are no Not Started, In Progress Actions associated with the risk.

---

**Risk Report by Project with Associated Actions**

**Project: PNGS Projects - 49161**

**Risk:**
- Event: Equipment and equipment design from vendor not delivered in time due to AFS delays.
  - Cause: OEM is late in delivering design deliverables.
  - Impact: Equipment cannot be installed by EPC until it has arrived.
- Event: Potential additional scope and delay in System Configuration / OEM design completion.
  - Cause: New technology is being used for telecom system.
  - Event: Equipment and equipment design from vendor not delivered in time.
  - Cause: Final design not yet firm with OEM for those areas.
  - Impact: Potential increase in costs.

**Recommendations**
- Track OEM to complete all their design deliverables.
- Track equipment and equipment design from vendor not delivered in time.
- Mitigate scope and delay in System Configuration / OEM design completion.
- Engage Real-Estate once the OEM design is complete to get final estimate for pricing.

**Actions**
- 6417: Track OEM to complete all their design deliverables.
- 6195: Track equipment and equipment design from vendor not delivered in time.
- 6418: Engage Real-Estate once the OEM design is complete to get final estimate for pricing.

#### Risk of Late Issuance of Execution Documents and Design Errors in Issued Documents

There is a risk of late issuance of execution documents and design errors in execution documents for the replacement of obsolete chemical analyzers project. The impact of this risk is increased cost and delay to schedule due to rework.

<table>
<thead>
<tr>
<th>Action #</th>
<th>Status</th>

<td>30 out of 35 packages accepted by OPG. C&amp;D is complete for 2 packages.</td>
</tr>
</tbody>
</table>

#### Risk that the Scope may Change

For the replacement of obsolete chemical analyzers project, there is a risk that the scope may change. This is due to as-found conditions and/or configuration issues (primarily with analyzers located in reactor buildings). Risk is increased cost to project to perform more construction activities.

---

20APR2016: Overall project schedule update in progress. Schedule update is taking longer than expected due to the significant project changes that have occurred since the previous schedule was approved. 6 remaining design ECs are progressing (see Risk Action #5534). For ECs with no firm TCDs, arbitrary dates will be used to populate the schedule until firm TCDs are available. For the 50 IOP analyzers, major IOP milestones will be included in the overall project schedule. These milestones are tracked at weekly project meetings and on the PCC whiteboard.

31MAR2016: Installation moves have been reviewed and finalized. Overall project schedule update in progress. 2 of the remaining 6 ECs have been submitted for review and comments, while the schedule for the remaining 4 is progressing, but final submittal dates are still TBD (see Risk Action # 5534). 50 analyzers are scheduled in IOP. Pre-requisites for these IOP analyzers are tracked at weekly project meetings.

25FEB2016: Installation moves have been reviewed and are being updated in order to finalize schedule. Design schedule for 1 of the remaining 6 ECs is in place, while the schedule for the remaining 5 is progressing, but requires manufacturer input. Follow up with manufacturer is occurring daily.

31JAN2016: Design issues have impacted 6 planned installations. These installations need to be moved downstream to allow for time to resolve design issues, which will also impact the downstream installations. Installation schedule is currently being reviewed to adjust all installation dates as a result of rescheduled installation moves.

---

Risk that the Scope may Change

For the replacement of obsolete chemical analyzers project, there is a risk that the scope may change. This is due to as-found conditions and/or configuration issues (primarily with analyzers located in reactor buildings). Risk is increased cost to project to perform more construction activities.

**Risk that Design Group is Lacking Experienced Personnel**

There is a risk that resources lack experienced engineering/installation personnel for the replacement of obsolete chemical analyzers project. If realized, this risk can cause increased cost and delay in schedule due to re-work activities.

26APR2016: U6 boiler cation EC accepted 15APR2016. Design walkdown for U1 and U4 held on 15APR2016. Field walkdown for U1/4 input zone conductivity analyzers held 20APR2016. Field walkdowns are performed as required to review installation issues, in addition to T-3 walkdowns performed by the work performers as per MA-022. U7 moderator conductivity readiness meeting scheduled for 09MAY2016. Field walkdowns for Fuel Bay conductivity and Radio conductivity analyzers will be completed in the upcoming month.

31MAR2016: U6 boiler cation EC to be submitted for acceptance by 06APR2016. Design walkdown was completed prior to EC revision. Design walkdown for U1 and U4 scheduled for 01APR2016. Field walkdowns are performed as required to review installation issues, in addition to T-3 walkdowns performed by the work performers as per MA-022. U7 moderator conductivity readiness challenge meeting scheduled for WW18 (May 2-6, 2016).

25FEB2016: Revision of 6 boiler cation ECs due to maintainability issues is progressing. Upcoming installation for U7 moderator conductivity analyzers is being reviewed in further detail due to first installation of this analyzer type. Readiness challenge meeting to be held.

31JAN2016: Path-forward determined for maintainability issues of boiler cation analyzers. 6 ECs require revision as a result. Lessons learned from U1, U5, and U6 H2 purity analyzer installations are being utilized for U4 H2 purity analyzer installation.

#### Risk of Delays Due to Late Material Delivery or Changes to Outage

For the replacement of obsolete chemical analyzers project, there is a risk that the schedule will be delayed due to late material delivery and changes in unit-outage schedule where analyzers are scheduled for installation.

- **29APR2016:** 30 of 36 design packages approved by OPG. 2 ECs have signed C&D. ECs have been returned to EPC vendor to incorporate comments. TCD for revised package is 04MAY2016. 4 remaining ECs are progressing (2 packages will require sponsor input for recently discovered potential scope changes). Design quality has increased due to currently assigned design personnel (both EPC vendor and OPG), but latent design errors (e.g. annulus gas ECs) and inexperience in project history necessitate more extensive oversight and follow-up by OPG.
- **31MAR2016:** 30 of 36 design packages approved by OPG. 2 of the remaining 6 ECs have been submitted for review and comments. 4 remaining ECs are progressing.
- **31JAN2016:** 30 of 36 design packages approved by OPG. Extensive follow-up and oversight still required by OPG personnel in order to complete contract deliverables. Path-forward for remaining 6 ECs has been determined.
### Risk Report by Project with Associated Actions

#### Design Risk

**Description:** Design is expected to be simple, involving only one work group. If designs require review by another work group, an increase in cost and schedule are likely to occur.

Risk Report by Project with Associated Actions

Report ID: 26APR2016: Manufacturer input obtained. Meeting to discuss path-forward held on 07APR2016. Design path-forward between RCM and OPG is confirmed for 2 EICs (moderator conductivity). For the 2 other EICs (liquid zone conductivity), it was identified that another EIC indicated that the probe for liquid zone conductivity analyzers would be relocated under our project. Further discussion with stakeholders identified issues with replacing probe at current location. A scope change proposal (including cost and time impacts) for liquid zone conductivity analyzers is being developed to be presented to the project sponsor. Presentation to the sponsor is to be completed by 06MAY2016. Path-forward will impact procurement for liquid zone analyzers, since an entire valve assembly would be needed to be bought. There are no procurement issues for moderator conductivity, however procurement for these 4 EICs would likely be significantly cheaper if all probes were purchased at the same time under one PO.

Design Agency has identified that it is possible that replacement probes for these analyzers may not be procurable. Design agency is to confirm whether or not the material is procurable and, if it is procurable, to initiate a PO.

There are no Not Started, In Progress Actions associated with the risk.

### Project: PNSG Projects - 13710

**13-40703 PB IFB B Leak Mitigation: Technical, Tool Design / Function - Schedule / Cost impacts**

Prototype Tooling will need to be designed and fabricated and then tested. If during field tests tooling does not perform as planned, re-designing and fabricating will result in additional costs and time. Cost and Schedule impacts.

Risk Report by Project with Associated Actions

41043 - Q - Completing technical specification and engaging OEM prior to establishing clear design requirements

Completing technical specification and engaging OEM prior to establishing clear design requirements i.e. prior to obtaining DA and OEM approval on the MEC package which usually consists of modification details, MDR, RTM, Software quality, HFE requirement. Tested engine may not meet all the requirements stated in revised TS. In this case, Station will be asked to accept the engine taking deviation to the approved revised specification. Rework may be required.

41043 - B - Seismic Qualification

Seismic Qualification of the engine is required. 1. OEM will not be performing seismic analysis and therefore OPG will need to engage another company such as Curtis Wright to complete the Analysis. If any issue is discovered in respect to the seismic analysis the engine has to be accepted with additional review/study as OEM will not alter any change to their standard engine design. 2. The speed probe and the backup overspeed module will also be done via analysis as the size and weight of these components are similar to the old one.

Risk Report by Project with Associated Actions

41043 - G - Acceptance of new engine emissions by environment group and MOE

With Fukushima project completion the existing emission level at Pickering is very close to the acceptable limit. The ministry may request OP to reduce the emission level for any new modification. New engine may not meet the present emission standard requirements per federal/provincial. Environmental group need to provide concurrence on this issue.

Action# Status Action Title Action Description Owner Delegate Due Date Comments
6353 In Progress 41043 - Acceptance of new engine emissions by environment group After obtaining the emission data for the new engine from the FAT, Projects will coordinate with the environmental group to confirm the acceptance and identify any new emissions modeling requirements by MOE. New actions may result depending on the outcome. Partha Chatterjee 15-Aug-16

41043 - L - New turbine fuel requirements are not compatible with OPG existing fuel specification.

New turbine fuel requirements are not compatible with OPG existing fuel specification. Excessive contamination in the fuel will reduce the turbine life and may create problems with control of fuel flow.

Action# Status Action Title Action Description Owner Delegate Due Date Comments
6461 In Progress 41043 - L - New turbine fuel requirements are not compatible with OPG existing fuel specification. Performance engineering to review the fuel requirement with component engineering and summarize any issue with fuel compatibility. As per initial review the delta in the fuel specification should not be a risk, ruling reviewed by SME. Dan Gleeson 30-May-16

41043 - M - Multiple modification work during EPG outage may impact engine installation

In the EPG outage there are other modification/maintenance work scheduled with the engine replacement. If the window for engine installation is not properly planned it will impact the engine installation schedule.

Action# Status Action Title Action Description Owner Delegate Due Date Comments
6704 In Progress 41043 - M - Multiple modification work during EPG outage may impact engine installation SWC to prepare integrated logic sequencing all the installation/testing activities. Separate logic to be prepared for installation and commissioning activities. Partha Chatterjee 16-May-16

41043 - T - OEM not providing technical documents

There may be a problem in meeting EPG reliability value as OEM will not be providing any customized technical documentation for the replacement engine. It also may cause last minute changes to the approved design packages.

Action# Status Action Title Action Description Owner Delegate Due Date Comments
6514 In Progress 41043 - T - OEM not providing technical documents Design contractor will try to obtain the reliability number through analysis. Additional actions may arise from the analysis. If required the OEM engine during final commissioning may need to undergo extended period of load run to obtain the reliability number. Mano Velayuthan 16-May-16

### Project: Pre-requisite Projects - 73365

#### 73365 CFVS - Lack of schedule float for weather delays

The weather during the spring months can be rainy and windy. If the winds are too high then crane activities cannot be performed. There is a risk that there is insufficient float in the schedule to account for poor weather conditions. If there is insufficient float then activities put on hold due to rain and/or high wind will cause a delay to schedule and increased costs for trades on standby and crane equipment rental.

#### 73365 CFVS - There is a risk that the Project EAC will exceed the current Project approved budget

It is forecasted that the Project EAC will exceed the current Project approved budget. The Vendor is continually submitting overtime requests and CTPs that are outside of the currently approved budget. This will result in additional cost to the project exceeding the approved budget. Approval at Gate 4 or through a CCN will be required to increase project funding.

---

**Risk Report by Project with Associated Actions**

Monitoring and data collection requirements for critical ACU and Pumps are not clearly defined. In addition, Fire Retardant Fluid (FRF) has now been included in this charter which was not part of the original charter.

There is a risk of further scope growth on this project. Depending on the requirements of this project, there is a risk of longer durations required to complete engineering (step backwards to complete Conceptual, Value Engineering, COMS, etc).
Due to errors in the schedule, there is a risk that the schedule is not realistic to achieve the AFS milestone due to errors in the schedule. This will impact the schedule and cause increase in costs to make up the time. Timely delivery of materials is at risk due to lack of availability of materials and late fabrication of prefabricated items. If materials are delivered late, there is a risk that it will delay the execution schedule. This will impact the schedule and cause increase in costs to make up the time.

### Reactor Safety review of CFVS HIR requirements traceability matrix identified potential need for project to purchase a new stack monitoring portable device. Project action to date was only to obtain suitable sample points to tie into a portable device provided by others. Risk is that a new monitor will need to be designed and purchased and tested, or test connected and commissioned prior to AFS. Project is ~ 6 months from final AFS.

### TFIRs have not been submitted for many documents requiring updates for the CFVS AFS in September. This task is with the ES MSA vendor to complete. OPG procedures group has submitted SCR D-2016-10006 to document the late TFIRs. If the TFIRs are submitted late then there is a risk that this will cause a push to the AFS milestone.

### The risk is that the final weight of PRV30 is not bounded by the stress and seismic analysis already performed for the CFVS system, resulting in design revisions and possible rework of fabricated components (eg. supports). This risk has been created due to late procurement of the component, and delayed acquisition of required information (weight & centre-of-gravity) from the manufacturer. This risk is documented in SCR N-2015-10572 and associated A/R 28180737. Also tracked via CFVS 1TIF Items 204 and 211.

**Project:** Transition between Engineering vendors

**Description:** There is a risk that the transition between the two engineering vendors may result in additional costs and schedule due to the state of the Revision 0 design package. In addition, field support from the new vendor on the previous vendors design may result in additional design changes due to different designers interpretation of codes/standards. This field support could cause construction delays. Also any latent design errors will have to be revised by the new engineering vendor.

**Action:**
- [ ] 3 Active Anthony Colella Aninda Dutta Ray 04-May-16 Accept 30-Nov-16 4 2 5 2 5 20
- [ ] 4 Active Anthony Colella Paolo Auciello 04-May-16 Mitigate 29-Jul-16 4 2 5 3 2 15

**Notes:**
- There are no Not Started, In Progress Actions associated with the risk.
- 

#### E-31555 D2O Storage

**Project:** 11 New Design EC's Completion Date

**Description:** The 11 new DEC's for JV to complete have a completion date (per the latest recovery schedule) of late 2016, threatening the installation and commissioning milestones.

**Action:**
- [ ] 3 Active Anthony Colella Paolo Auciello 04-May-16 Mitigate 29-Jul-16 4 2 5 3 2 15

**Notes:**
- Completion dates are based on vendor documents being made available. Each EC has a 4 month window for this.

#### E-31555 D2O Storage

**Project:** Construction Delays Due to LLM Ordering Delays

**Description:** There is a risk that long lead materials (LLM)/Bulk materials will not be ordered/delivered in time to support the construction schedule.

**Action:**
- [ ] 3 Active Anthony Colella William Tannous 04-May-16 Mitigate 31-May-16 4 2 5 4 2 20

**Notes:**
- Valves are with JV to receipt impact promotion tanks - T11 had a cracked head, and is being reworked. OPG to meet with them weekly of Mar 7 to assess impact and expedite as needed. Apr 1, 2016 - Tank11 replacement head has been received in Port Robinson and fabrication is in progress. TCD for arrival of T11 is April 30, 2016. May 4, 2016 - TK11 to be delivered May 5, 2016.
### Risk Report by Project with Associated Actions

#### 96-3155 - CWP Production Rate

- **Event:** The APS data is delayed due to currently undefined commissioning strategy and schedule logic.
- **Cause:** Undefined Commissioning Strategy
- **Impact:** Delay NR U2 Moderator drain.

**FOX to upload the material data in the FOX database to the PTT database**
### BPG3 - Commissioning of EPG3 may take longer than anticipated

Due to specialized resource requirements and complex permit requirements, the risk is that the commissioning of this new system may take longer and be more challenging than estimated impacting schedule. In addition, as of January 2016, OPG assumed the commissioning planning work from the Vendor which could result in additional challenges during the transition of responsibilities.

### EPG3 - Critical Spare Parts Unavailable for APS

There is a risk that critical spares may not be available for the scheduled APS due to the late identification of the spare parts list. The unavailability of spare parts would threaten the APS being completed and a risk to meeting the Refurbishment breaker open commitment.

<table>

### BPG3 - IESO Approval for new Generator may affect APS date

Generator is subject to IESO registration. This was identified late. Engineering will request an IESO "exemption". If this "exemption" is not accepted, then the scheduled APS date will be at risk because EPG3 could not be connected to the EPS bus during testing. In addition, if the exemption is not acceptable, then EPG1 and EPG2 could be impacted since the modifications required to support the EPG3 registration will impact the the other EPG's through a common relay.

The STOP MDR requires the STOP setpoint to be selected such that the pressure pulse when relieving the shield tank does not fail containment, including the fuel transfer bulkheads installed during refurbishment. The overpressure failure limit for the bulkhead, as stated in the MDR, is 96.5 kPa(g). At this value, analysis shows it is not possible to meet the above requirement with a 440 kPa RD. However, additional analysis is currently being performed which will show, with a very high level of confidence, that the actual failure limit for the bulkheads is 275 kPa (same as the rest of containment). At this value, the MDR requirement is met with a 440 kPa RD.

Current indication from the analysis is that the bulkhead failure limit is 275 kPa or higher, with very little risk that the analysis will conclude otherwise. The Outage Milestone Recovery TCO for issuance of the EC revision (to increase the RD setpoint to 440kPa), is 21-Mar-2016. The TCO for the bulkhead failure limit analysis is 20-Apr-2016. Until the bulkhead failure limit analysis is complete there is an associated risk to the project. The EC revision will be approved and released per the Outage Milestone Recovery Plan.

<td>Vijey Pandya</td>
<td>28-Dec-16</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The decision was made by the refurbishment organization that the DTL support will be provided by OSS contractor instead of OPG resources. This will have an impact on project cost if refurb do not transfer funds.

---

### 73472 D2O Islanding - Accessibility Issues During Installation Phase

Locations within the Darlington station where the modification is taking place are typically accessible to workers during normal unit operation. These locations have the potential to become inaccessible for periods of time due to elevated radiological fields and/or surface contamination, as a result of changing unit operating conditions. Unit outages may be required to perform a portion of the installation.

---

### 73472 D2O Islanding - Permitry

Potential for delays due to permitry requirements. Permit application to start installation may be delayed due to station resource, delay in draining headers or system alignment issues.

---

### 73472 D2O Islanding - Interaction with Bellows Project

Potential for delays due to shared permitry requirements with the Bellows installation project during execution. Bellows (Initiatively 2016WW02): Due date adjusted to T-21 for the most recent proposed installation schedule. (The decision was made by the refurbishment organization that the DTL support will be provided by OSS contractor instead of OPG resources. This will have an impact on project cost if refurb do not transfer funds.)

<td>Tracking to correlate material availability to EC for purposes of determining material status for each EC.</td>
<td>Bill Devlin</td>
<td>01-Dec-15</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Results:**

- Project status meeting June 2 - requested an updated, consolidated list of outstanding materials. Directed contractor to enter RFQs for materials to be procured through ORG.
- June 16 - requested updated list that includes purchase order information for all materials.
- Previous list did not have information for several materials.
- July 20 - receiving weekly updated material lists from RCMT.
- August 31 - all modification material on hand except for pipe clamp - engineering decision on clamp due Wed. Sept. 2. T-Alt material still outstanding and being followed up by Supply Chain.
- Sept. 18 - Alternate pipe clamp to be procured through ORG.

### Project: Pre-requisite Projects - 73472

- **Issue:** Discovery work during installation
- **Impact:** Discovery work may result in a requirement to develop an additional schedule for installation and commissioning.

#### 73472 D00 Islanding - Discovery work during Installation Phase

- Potential for delays due to material availability. Discovery work will delay pre-fabrication activities, challenging readiness for installation of moderator header work prior to VBO 2015.

<table>
<thead>

</tbody>
</table>

**Actions:**

- In Progress: Discovery work during installation
  - Project Manager to ensure detailed walkdowns are held with the design and construction team prior to the start of installation. Issues related to installation and commissioning raised during COMS, challenge meetings, installation readiness meetings, etc., shall be dispositioned by the design team in order to anticipate and avoid potential discovery issues in the field.

**Comments:**

- June 2/15: Additional walkdowns organized to identify issues related to header draining strategy - planned for June 3. Aug. 31/15: Additional walkdowns held in July and August to verify dimensions.

### Project: Pre-requisite Projects - 73473

- **Issue:** Discovery work during installation
- **Impact:** Discovery work may result in a requirement to develop an additional schedule for installation and commissioning.

#### 73473 D00 Islanding - Material Availability

- Potential for delays due to material availability. A delay in material delivery will delay pre-fabrication activities, challenging readiness for installation of moderator header work prior to VBO 2015.

<td>MTL to coordinate with Engineering to determine whether existing design has sufficient power supply.</td>
<td>Nunzio Mastrotcola</td>
<td>Maninder Sethi</td>
<td>31-Aug-16</td>
<td></td>
</tr>
</tbody>
</table>

**RSF Prerequisite project delays (No Window Related)**

- **EVENT:** Prerequisite work required before breaker open may be delayed. **CAUSE:** 1) Poor quality field work due to OPG-applied schedule pressure (Some project designs are currently delayed and challenging N-PROC-PA-0022 milestones). 2) OPG inefficiencies in review and late scope identification. 3) Vendor(s) delays in achieving target field work due to OPG-applied schedule pressure (Some project designs are currently delayed and requiring plastic suits. 4) OPEX from U1/2 trailer transport and laundering turnaround. The manufacturer is a single source provider and present commitments to other facilities precludes the project from obtaining additional suits until 2018. The risk is that the contingency requested at Gate 3 for the Holt Road work being performed by the MTO is underdetermined due to OPG's lack of expertise in executing this type of work. This may result in a requirement to use additional contingency during execution of the work.

</tbody>
</table>

---

#### Project: Refurbishment Construction -

**RSF Facilities Custodial and Maintenance estimate has high uncertainty**

- **EVENT:** Custodial and maintenance for RSF facilities was estimated at Stage 5. This included ongoing maintenance and custodial services for Washroom, WCA, RPT, Contaminated and Non-Contaminated shops/work areas. There is a risk that the budget being transferred to NR Construction may not be sufficient to perform the services over the duration of Refurbishment.

Risk Report by Project with Associated Actions

### Project: Refurbishment Support Facilities - 10000

**Event:** Refurbishment Milestone to commission the Portable Radiation Instrument Laboratory, located at PSB (1569 Victoria St. E., Whitchy) is being tracked under A/# 2818282-05 and is due by August 15, 2016. Facilities Projects is projecting that the facility will not be available until December 2016 at the latest.

**Impact:** Delays to the feeder fabrication schedule will further challenge the availability of feeder fabrication and qualification for Inconel 690 using filler metal 52M are expected. Challenges associated with dissimilar metal welding procedures and for the Upper Feeder assemblies will not be available in time for schedule site execution date.

**Cause:** Flow Element and Pressure Breakdown Orifices material has been changed to Inconel 690 elements and PBOs could delay site installation of feeders if not manufactured in a timely manner. The feeder flow elements (FEs) and pressure breakdown orifices (PBOs) are to be manufactured and delivered to the feeder fabricator and then need to be welded to the upper feeder assemblies prior to shipping them to site for installation. The current start date for upper feeder installation is October 2015.

**Impact:** Negative impacts on schedule and cost.

### Event: \#1

**Event:** Vertical Striker Plate (Potential Risk Category: Class II) Event: the Vertical Striker Plate (sidex and top) may be damaged in the maneuvering of the transportation vehicle with the vertical airlock #1. Impact: negative impacts on schedule and cost.

**Action:**

### Risk Report by Project with Associated Actions

**Draft:** 12-May-16 10:30 PM

---

#### Risk Identification

**Excusable Delays (Windows All)**

**Category:** Execution Phase

**Description:** Due to conditions beyond the control of JV and OPG. RFR, 5.2 (a) Excusable Delays. Section of EPC Agreement explains the condition and the contract terms of excusable delays, which have impacts on Execution Phase Schedule. This risk concentrates on delays of more than 3 days. The examples include, but not limited to:

- Radiation conditions (tritium, alpha, dekors, high activation product concentration, high radioactive debris/particles) higher than expectations causing delays in cleanup (> 3 days);
- Fueling machine spins unexpectedly (> 3 days) below the bulkhead of the Unit being refurbished with Labour Force in the vault working on critical path;
- Unplanned Fuel Handling activities affecting duct access (> 3 days);
- Applicable to critical path refitment work in the duct;
- Required upgrades/repairs/maintenance to OPG existing facilities (> 3 days);
- Unexpected operating plant transients with impacts > 3 days on critical path;
- Delay in completion of work required to be completed by OPG (or its vendors) (> 3 days);
- Reactor not defueled on time as scheduled by OPG (> 3 days);
- Delay in Breaker Open milestone (> 3 days);
- Loss of station power (OPG supply) to run JV equipment / tools (> 3 days);
- D2O spills (> 3 days);
- Activities in operating units (including testing and Safety Related System) Test of adjacent operating units) causing interruptions in refurbishment work (> 3 days);
- Evaluation of POC and FAT testing will require a troubleshooting/continuity plan as part of the CM for final procedures milestone acceptance.
- Contingency Plan for end of August to accommodate the Stand-By Plan completion.

**Event:** Not enough spare bellows for all 4 units

**Impact:** There is a risk that Transfer Flask cannot be manufactured and/or delivered on-time, due to delays in placing in the order, schedule compression due to misunderstanding of need by date, and potential production ramp-up risks based on ORPX from previous similar fabrications. IMPACT: Transfer Flask will not be delivered on time to meet Window (End fitting removal) of Unit 2 Level 1 outage.

</tr>
</tbody>
</table>

---

#### Action Log

**Action Logs:** 12-May-16 10:30 PM

---

**For Internal Use Only**
### Reactor Core Components

**Demand more RW/CDSO (Window 114)**

- **Event**: As results of characteristics of irradiated reactor core components, the risk of more RW/CDSO needed.
- **Cause**: (1) Lid not being able to be closed due to pipe height of wastes inside RW/CDSO during waste reduction being too high, and (2) excessive waste emissions from waste inside RW/CDSO may occur with negative impacts on schedule.
- **Impact**: Additional funding required for more RW/CDSO.

### Owner Specified Material

**OSM pricing from Unit-to-Unit Procurement (No Window Related)**

- **Event**: There is a risk of cost escalation of the OSM pricing.
- **Cause**: Due to Unit-to-Unit Procurement, vendor price increases and foreign exchange.
- **Impact**: Change to budget allocation.

### Line Spacers and Liner Latch Assemblies

**Not available in time for Fuel Channel installation**

- **Event**: There is a risk that Liner Spacers and Liner Latch Assemblies manufacturing will be delayed beyond the need by date for execution.
- **Cause**: The delay is due to time lost through the purchasing and document review/acceptance phase of work (cannot be recovered), and for a longer than expected manufacturing process as proposed by the vendor.
- **Impact**: Liner spacer and latch assemblies are required on site prior to the fuel channel installation series which is scheduled for August 2018.

### Not Enough commissioning

**Training Time for Volume Reduction System in Refute Waste Processing Building (RWBP) (Window 130)**

- **Event**: Due to RWBP construction being late (potential), the risk of not having enough commissioning / training time for Volume Reduction System.
- **Cause**: RWBP construction schedule slippage.
- **Impact**: Potential for negative impacts on Execution Phase schedule.

### Extra testing to be completed

**at Vendor Location**

- **Event**: Extra testing to be completed at Vendor Location.
- **Cause**: Extra testing is being done to prove more reliability. EF RAM. A new process has been written to recover PT.
- **Impact**: Potential for negative impacts on Schedule.

### More Expensive Pressure Tubes

**for subsequent units (No Window Related)**

- **Event**: Event is a risk that if only one brand of pressure tubes (PT) are used in all four units, then the cost of 3 more units of PTs will be higher than the cost estimate used in the Class 2 estimate.

---

### Technical Details

**Event**: Extra testing to be completed at Vendor Location.

- **Action**: Extra testing to be completed at Vendor Location.
- **Description**: Extra testing is being done to prove more reliability. EF RAM. A new process has been written to recover PT.
- **Status**: In Progress
- **Owner**: Jeffrey Palmateer
- **Delegate**: Jeff Grodat
- **Due Date**: 15-Oct-16
- **Mitigation action estimate**: $1.5M

---

### Extra Duration Caused By

**RPs Review (Potential Window 160-180)**

- **Event**: Risk of Rework to correct work, Goods or OSM that is not Defective exists. Cause: Due to the size and nature of the project.
- **Impact**: Negative impacts to Schedule, notwithstanding the exercise of Prudent Practices.

---

### More Expensive Pressure Tubes

**for subsequent units (No Window Related)**

- **Event**: Event is a risk that if only one brand of pressure tubes (PT) are used in all four units, then the cost of 3 more units of PTs will be higher than the cost estimate used in the Class 2 estimate.
### Failure to Upgrade Unqualified Source Material for 3690 Flow Elements / Pressure Breakdown Orifices

</tr>
</tbody>
</table>

#### Cause:
- Caused by using the lower priced of the two supplier's single unit bid cost (2013) as the expected cost for subsequent units.

**Impact:**
- This would result in a need for additional approved funding/budget if only the more expensive supplier's PTs are installed in subsequent reactor units.

**Event:**
- There is a risk that the supplier of Flow Elements (FE) and Pressure Breakdown Orifices (PBO) may fail to upgrade the unqualified source 3690 BAR stock they have purchased if due to its quality issues are revealed during the upgrading process.

**Cause:**
- The supplier of FE and PBO's have purchased unqualified source 3690 BAR stock material because nuclear grade 3690 is not a readily available product on the market. The supplier will be upgrading unqualified source 3690 BAR stock material in parallel with machining activities in support of schedule recovery impacts.

**Impact:**
- Should the supplier find that the unqualified source material cannot meet the AIME requirements, rework would be required, beginning with ordering new 3690 BAR or pipe stock. This would have significant schedule implications.

### Insufficient Tooling Intellectual Property Escrow (Potential Window 160-188)

**Execution Phase Risk: Large of a kind in Darlington Vault (Window 160-188)**

<table>
<thead>
<tr>
<th>Action#</th>
<th>Status</th>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Active</td>
<td>Michael Hersch</td>
</tr>
<tr>
<td>2</td>
<td>Active</td>
<td>Michael Hersch</td>
</tr>
</tbody>
</table>

#### Cause:
- As a result of Incomplete Engineering Package filing and insufficient documentation of software tools in Intellectual Property (IP) Escrow, combined with a contractor default, the risk of inability to tackle a technical issue may occur during the Definition / Execution phases, which would lead to negative effects on RFR schedule + RFR cost.

**Event/Cause/Impact:**
- As results of Retube Tool Platform (RTP) being the first-of-a-kind platform installed in the Darlington vault with various constraints, the risk of more downtimes of the installation than planned may occur in Unit 2 with negative impacts on Execution Phase schedule.

### Above and Beyond Assumptions Escalation Cost (Potential Window 160-188)

**Execution Phase: Large of a kind in Darlington Vault (Window 160-188)**

<table>
<thead>
<tr>
<th>Action#</th>
<th>Status</th>
<th>Action Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Active</td>
<td>Ray Brown</td>
</tr>
</tbody>
</table>

**Event:**
- Due to some costs that are uncontrollable by OPG and JV, the risk of higher costs flown through JV to OPG may occur with negative impacts to the Execution Phase cost. The examples of cost above and beyond assumed escalation cost include the following, but not limited to:
  - Amendment to labour agreements such as Nuclear Project Agreements (NPA);
  - One or more unions not signing the labour agreements such as NPA;
  - Amendment to travel and boarding provisions;
  - Inadequate LOA allowances due to higher than expected out-of-province / international labour forces;
  - Higher than expected commodity pricing such as Fuel Channel Closure Plug costs

**Cause:**
- Due to safety events or near-misses (specifically not related to JV's negligent work)

**Event:**
- OPG stopping the work order(s) may occur

**Impact:**
- More no Not Started, In Progress Actions associated with the risk.

**Action Description**
- Above and Beyond Assumed Escalation Cost [Potential Window 160-188]

---

Run by: L. Greenland

<td>Tara Rehsi</td>
<td>15-Oct-16</td>
<td>$1M budget on additional qualification requirement on vault workers.</td>
</tr>
</tbody>
</table>

**Quality issues of JV work causing extra rework (Window 23)**

**Event:** Extra rework (including higher welding failures (feeders not meeting tolerance, feeder over bend, welding procedures and human performance involved), work in bellow cut, feeder overbend, feeder not meeting tolerances, CT install, PT extraction, CT head).

**Cause:** Quality issues of JV work

**Impact:** May occur with negative impacts on schedule.

**End Fittings will not be available in time to support the scheduled site execution date (Window 68)**

**Event:** There is a risk that End Fittings will not be available in time to support fuel channel installation (execution window 119).

**Cause:** Caused by various issues with the overall procurement steps and strategies as well as complications with individual components.

**Impact:** This would result in a miss of the Execution Date. Therefore reducing the amount of available time for JV to unpack, inspect and assemble sub-assemblies in preparation for the fuel channel install series.

**JV Risk 8.118**

There are no Not Started, In Progress Actions associated with the risk.

**Waste - Insufficient Number of Retube Waste Containers (Window 117)**

**Definition Phase:** As a result of many risks, such as the set listed below, the risk that a larger number of Retube Waste Containers needed than planned may occur during the Execution phase, which would lead to negative effects on both schedule and cost. Examples of risk requiring larger number

---

Run by: For Internal Use Only

Page 1 of 1
of Retube Waste Containers are: 1) Inefficient segregation practices are encountered. 2) Container may not be optimized for, or compatible with, the volume reduction process. 3) Latest discovery of higher than anticipated level of Cesium-137 in pressure tubes which may trigger need of extra RWCs.

**Claims from Retube and Feeder Replacement (RFR) Vendor Not already Covered in the Contract (Potential Window 160-188)**

**Execution Phase**

As a result of OPG not meeting its obligations, there are risks of the RFR vendor making claims for additional costs, cost claim from schedule delay not covered in the Contract, in the Execution Phase.

Note: there is a similar risk for Definition Phase (risk #12214).

<td>28/Apr/2016: Action delegation requested from Ken Brown and Jeff P. – Two FTEs are estimated to cost $2M incremental for the entire RFR Project for 4 units. 1. Turnover Tasks to record the turnover conditions, including photos of components such as AGS pigtails, before JV and after JV for documenting the environment before and after to provide evidence to support or deny JV's claims in future investigation. 2. Phased turnover of operations to construction (As components are accessible, OPG to do inspections). Formal report to be generated from these inspections and given to contractor. 3. Dedicated OPG oversight team to integrate with JV As Found Team to document potential JV claims in real time (e.g. Two FTEs for entire project duration) Mitigation Cost: $2M (incremental)</td>
</tr>
</tbody>
</table>

### Additional Risks
- **Risk of need to procure additional pressure tubes (No Window Related)**
  - **Execution Phase:** Event: An additional set of pressure tubes may need to be procured if OPG decides to install pressure tubes manufactured by only one supplier across all 4 units. This would potentially bring the total number of reactor worth of PTs to 5.
  - **Cause:** OPG may decide that all pressure tubes installed in Darlington Refurbishment must come from one vendor. For the first unit, RFR scope include procurement of two full reactor quantities of pressure tubes from two separate vendors as a commercial risk mitigation strategy. The current project estimate includes 2 additional reactor quantities of pressure tubes (for a total of four reactor quantities).
  - **Impact:** The pressure tubes from the vendor not installed in Unit 2 will not be usable by Refurbishment, and an additional reactor quantity of pressure tubes will need to be procured.

### Supporting Actions
- **RPS - Reliable Waste Processing Building Too Humid for Tooling Electrical**
  - **Execution Phase:** Event: There are no Not Started, In Progress Actions associated with the risk.
**Risk Report by Project with Associated Actions**

**Components**

There is a risk that electrical components in the WTS may fail due to high humidity in the RWPB.

**Cause:**
The waste tooling system contains electrical components that have a maximum humidity rating of 80%. This is not in compliance with the OPG Tooling Design requirements of 95%. There is a residual risk to OPG of delay due to a JV response to procure more spares of sensitive electrical components affected by the 95% humidity.

The RWPB Tech Spec for active ventilation, NK38-TS-73600-10003 R00 has a maximum humidity requirement of 80% however there is a risk that with the number of overhead door openings for truck entry and exiting that this may not be maintained in the cases where outside humidity is high. Impact: Potential critical path delays due to frequent component replacements and/or insufficient spares if rapid/common mode component failure on high humidity days.

**Toolkit Modification due to Station Status Documents for Units 1, 3 & 4**

**Event:**
There is a risk that Station Status Documents (SSD) for units 1,3,4 will reveal anomalies that challenge tooling design or MOD packages. Preparation of SSDs for future units have not yet been started.

**Cause:**
The station status documents were generated for Unit 2 only. Upon review of the station status documents, there were anomalies identified that challenged the tooling design which had to be accounted for. The station status documents for Units 1,3,4 are not initiated so any anomalies in those units are not considered in the current design of the toolkit.

**Impact:**
Modifications to the toolkit or MOD packages may be required. The cost of completion of the station status documents for Units 1,3,4 are considered in the class II estimate. However, the cost of any modifications to the tooling or MODs is unknown.

**WRC/DSO may not be delivered on-time (Window 114)**

**Event:**
WRC’s will not be delivered on time to meet Window 114 (End fitting removal) of Unit 2 Level 1 outage.

**Cause:**
There is a risk that retube waste containers cannot be manufactured and/or delivered on-time, due to delays in placing the order, schedule compression due to misunderstanding of need by stock points, and potential production ramp-up risks based on OPEX from previous similar fabrications. IMPACT: Critical path delays.

**Risk of Vendor Default/Business Continuity**

**Definition Phase / Execution Phase:** Due to vendor default, the vendor is unable to meet the contractual obligation it may have negative impacts on cost and schedule to re-organize the teams to continue RFR project.

**Claims from Retube and Reposter Replacement (RFR) Engineering, Procurement and Construction (EPC) Vendor (Potential Window 160-188)**

**Event:**
As a result of OPG not meeting its obligations (for instance: Contractor’s Access to Site for Retube Waste Processing Building (RWPB), there are risks of the RFR EPC vendor making claims for additional cost and schedule in the Definition Phase, per article 4 of the Agreement. Note: It will be raised as another risk (#13329) for the Execution Phase.

**Concealed Conditions (Potential Window 160-188)**

**Event:**
Due to uncontrolled and unknown conditions inside the vault, especially, those inside the reactor, 4.8 Concealed Conditions Section of the EPC Agreement explains the condition and the contract terms of concealed condition, which can have cost and schedule impacts on OPG and Construction (EPC) Vendor (Potential Window 160-188).

## Risk Report by Project with Associated Actions

### Execution Phase

**Not able to dry PHT System with Bulk Dry Proposal**

- **Event:** The joint venture has decided to go with a bulk dry strategy that would use the PHT Vacuum Dry tooling to remove all of the water in the PHT system from the Very Low Level Drain State (VLDDS).

- **Cause:** The residual risk that the Channel Drain Tool is required during execution, as contingency Channel Drain Tool has been procured and accepted by OPG as a contingency. The original plan to create a tie-in point (MOD) to interface with the channel drain tool with D2O collection has been cancelled. This CWP instructions on how to implement the channel drain tool were cancelled. JV and OPG SMEs reviewed the risk of requiring CDT if bulk PHT failed to remove all water in Jan 2016 after successful completion of FAT testing of the system at TKMS in Oct 2015. This review determined the likelihood of the risk occurring was sufficiently low that the CWP were not required.

- **Impact:** This decision was documented in the JV risk register and was part of the evidence package for OPG acceptance of the CDT final design.

**Execution Phase Risk.**

**Event:**

The joint venture has decided to go with a bulk dry strategy that would use the PHT Vacuum Dry tooling to remove all of the water in the PHT system from the Very Low Level Drain State (VLDDS).

**Cause:** The residual risk that the Channel Drain Tool is required during execution as contingency Channel Drain Tool has been procured and accepted by OPG as a contingency. The original plan to create a tie-in point (MOD) to interface with the channel drain tool with D2O collection has been cancelled. This CWP instructions on how to implement the channel drain tool were cancelled. JV and OPG SMEs reviewed the risk of requiring CDT if bulk PHT failed to remove all water in Jan 2016 after successful completion of FAT testing of the system at TKMS in Oct 2015. This review determined the likelihood of the risk occurring was sufficiently low that the CWP were not required.

**Impact:** This decision was documented in the JV risk register and was part of the evidence package for OPG acceptance of the CDT final design.

**Causal and Impact:**

- If the bulk dry process is not successful at Darlington, it will not be easy to revert back to a Channel by channel drain process as there will be no D2O transfer system tie-in and two major parts of the tools are not being delivered. The risk would result in having to drain and drum each fuel channel, with significant impact on critical path and increased radiation exposure to workers.

**Execution Phase Risk.**

**Event:**

The joint venture has decided to go with a bulk dry strategy that would use the PHT Vacuum Dry tooling to remove all of the water in the PHT system from the Very Low Level Drain State (VLDDS).

**Cause:** The residual risk that the Channel Drain Tool is required during execution as contingency Channel Drain Tool has been procured and accepted by OPG as a contingency. The original plan to create a tie-in point (MOD) to interface with the channel drain tool with D2O collection has been cancelled. This CWP instructions on how to implement the channel drain tool were cancelled. JV and OPG SMEs reviewed the risk of requiring CDT if bulk PHT failed to remove all water in Jan 2016 after successful completion of FAT testing of the system at TKMS in Oct 2015. This review determined the likelihood of the risk occurring was sufficiently low that the CWP were not required.

**Impact:** This decision was documented in the JV risk register and was part of the evidence package for OPG acceptance of the CDT final design.

    - 30-Jun-16

Unforeseen Challenges / Complications in installing re-designed components [Window 17, 119]

Execution Phase:
- Event: Unforeseen challenges / complications in installation of re-designed items may occur
  - Cause: Due to re-design of components such as End Fitting Closure Plugs and Garter Spring Spacers.
  - Impact: Negative impacts on Execution Phase cost and schedule.

- In Progress
  - Check List as part of the Detail Engineering.
    - Tara R 2015/07/02: Final numbers will not be determined until analyzed by TUF just before execution.
    - Michael Hersch
    - Jeffrey Palmateer
    - 30-Jun-16

Project: Retube and Feeder Replacement - TL

- In Progress
  - Tool change control [Potential Window 160-168]
    - Event/ Cause/ Impact: As a result of the Lack of Change Control on Tooling leading to Unanticipated Design Changes to tooling, the risk of unexpected damage to the reactor or failure to perform may occur in the Execution Phase, which would lead to negative effects on * RFR schedule * RFR cost.

- In Progress
  - Tool Management Plan contents
    - Ensure the following material is included in Tool Management Plan: roles and responsibilities (addressed 20150421), contingency planning (addressed 20150421), limits of authority, physical/security controls
    - Michael Hersch
    - 30-Jun-16

- In Progress
  - Review of Tool Management Plan on Procedural Control
    - Conduct a review to ensure adequate procedural controls are in place with the JV.
    - Michael Hersch
    - 30-Jun-16

- In Progress
  - Checklist as part of Detail Engineering on Tooling
    - As per Tooling Quality Design Plan, populate the Checklist as part of the Detail Engineering.
    - Michael Hersch
    - 30-Jun-16
### Risk Report by Project with Associated Actions

**Insufficient Tool Quantities or Spares for RFR Execution - all cases (Potential Window 160-188)**

#### Execution Risk

This risk combines four risks related to Tool Qty and Spares: 13917 Insufficient Tool Qty, 13332 Insufficient Tool Maintenance, 13917 Insufficient Tool Qty and Spares, 13570 Tool Damage during Transition and Shipping. Event: RFR Tool breaks during execution and cannot be replaced due to no backup spare. Tool available per Part Supply List (PSL). Details of estimated Tool Series failure modes are described in Class 2 estimate risks associated with each series. The joint tool series risks are owned by the JV. This is the residual risk to OPG. This risk also includes the case where tools cannot be readily repaired. Spares parts have been identified by tool designers (sub-vendors). Tool failures associated with sufficient spares, quality of maintenance and repair of the tools, as well as shipping and handling to/from/within site are owned identified by tools designers (sub-vendors). Tool failures with known failure modes occurred more frequently than expected leading to insufficient spares tool or spare parts for repairs. (Risk 13566). Ineffective Practices in Maintaining the Tools. (Risk 13566). Damages to tools during transitions and shipping to site. (Risk 13570). Impact: Schedule delay, potentially long lead items if Tools cannot be repaired and all tools on PSL in Class 2 estimate risks associated with each series. The joint tool series risks are owned by the JV. The risk is the residual risk to OPG. Cause: This risk combines four (4) types of failure modes leading to insufficient tools/spares leading to critical path schedule delay.

### Project: Retube and Feeder Replacement - 10000

#### Waste - ILW containers for non-standard waste streams [No Window Related]

**Definition Phase:** There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. Examples of such waste stream include the primary VRS press, chute and primary HEPA filter. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest.

</tr>
</thead>
<tbody>
<tr>
<td>5929</td>
<td>In Progress</td>
<td>The plan for the VRS press and chute</td>
<td>1: Decontaminate in the WTS using CO2 blasting 2: Debris from CO2 blasting will go into a RWC/DSO assembly 3: Following decontamination, the press will be removed and placed in a &quot;strong box&quot;. This &quot;strong box&quot; will either be stored on-site or off-site for approximately 10-15 years (after storage period, the press will be size reduced), or will be shipped to a decontamination facility for further decontamination and size reduction. For this plan to be viable, the following concerns will need to be addressed: 1: Impact of decontamination debris in the RWC/DSO assembly (long term storage) 2: Potential and impact of condensation build up during decontamination. There should be no water in the retube waste container 3: Need specification of the proposed &quot;strong box&quot;. At a minimum, this will still need to meet Ministry of Transportation requirements (tie-downs) for on-site transfer 4: To confirm that the EA and licence of the RWSB can accept the new waste stream.</td>
<td>Yung Cheung</td>
<td>03-Jun-16</td>
<td>Cameron Webb</td>
<td>06 May 16 - The CEP will be updated to include steps to ensure there will be no water in the RWC from in-situ decontamination. The &quot;strong box&quot; will be developed once the RWN has been processed. The TCD for the approval of the RWN is May 13, 2016. The steps associated with the assessments (EA) will be identified in the completed RWN. 28 Jan 16-On Track</td>
</tr>
<tr>
<td>5930</td>
<td>In Progress</td>
<td>The plan for primary HEPA filters and Misc. ILW</td>
<td>The plan for the primary HEPA filters and misc. ILW is to place the waste items in the RWC/DSO assembly. For this to work, an interface for the RWC/DSO assembly to allow the waste to be safely placed in the waste container will need to be designed. The concerns associated with this plan are: 1: Safety assessment may need to be revised to assess the impact of the proposed waste streams 2: Long term safety: filters will contain fine zincium dust, so there is a higher chance for a fire to occur in the RWC/DSO assembly during storage 3: Need to confirm if the waste should go into the RWC/DSO assembly or the Darlington in-station flask.</td>
<td>Yung Cheung</td>
<td>30-Jun-16</td>
<td>Cameron Webb</td>
<td>05 May 16 - The primary HEPA filters and VFF (Vacuum Filter Flask) filters will be going into the RWC. The types of assessments that need to be performed to demonstrate that there are no additional risks to the RWSB with this new waste stream have been identified. These assessments will identified in the RWSB New Waste Form process. The JV has a preliminary interface design, which has been reviewed by OPG. The JV will submit a cost estimate for this the interface (design and fabrication) for OPG to review and accept. 28 Jan 16-On Track</td>

Process Owner: R. Smith
Data Refreshed: 12-May-16 10:30 PM

Waste - Inefficient Waste planning and practices
(Window #117)

Definition Phase: Unplanned waste combined with inefficient practices could lead to negative impact on both schedule and cost.

1) Activity of the waste targeted for the containers are higher than assumed preventing the containers from being filled to capacity.
2) The process of loading Intermediate Level Waste into the containers impacts the packing factor.

Waste Forecast report to be updated at the end of March 2015.

17-Aug-15: Even though RWFAs are only required to be submitted one month prior to shipment, high priority RWFAs are being pushed to identify risk and drive engineering of the containers.

6-May-15: High priority RWFAs will be submitted on 8-May-15, OPG to review and then forward to Waste Acceptance Coordinator.

Ongoing: At high priority RWFAs have been submitted for new CP, the OPG has given the CPGs a list of new CPs.

13-Jun-15: OPG has reviewed RWFAs and have no comments. OPG new waste coordinator to coordinate to stakeholders for their review.

25-Jun-15: New waste form has been initiated. Waiting for JV to provide additional information so that new waste review can be initiated.

17-Aug-15: A schedule is to be developed that shows the timeline for procurement of containers.

24-Apr-15: Even though RWAs are only required to be submitted one month prior to shipment, high priority RWAs are being pushed to identify risk and drive engineering of the containers.

6-May-15: High priority RWAs will be submitted on 8-May-15, OPG to review and then forward to Waste Acceptance Coordinator.

29-May-15: All high priority RWAs have been submitted for new CP. OPG waste coordinator to circulate to stakeholders for their review.

11-Jun-15: All high priority RWAs are submitted. OPG waste coordinator to circulate to stakeholders for their review.

20-Jul-15: Beginning to receive comments back from stakeholders on the RWAs.

10-Aug-15: New waste form has been initiated. Waiting for JV to provide additional information so that new waste review can be initiated.

17-Aug-15: A schedule is to be developed that shows the timeline for procurement of containers.

6-May-15: It is working on outstanding issues.

**Risk Report by Project with Associated Actions**

**Window Related**

**Impact:** This could incur rework to the superstructure design, impacting cost and schedule of the Definition Phase.

### OP2 - Complete Nuclear Safety Assessment

**OPG to provide oversight/assistance to Joint Venture to execute the Safety Assessment for Retube Waste Processing Building.**

**Data Refreshed:** 07-May-16 10:30 PM

**Action Details:**
- **Event:** Late delivery of Structural Steel
- **Cause:** NSA requirement date drove the steel tech specs late in the schedule

**Schedule Progress:**
- **25-Sep-14:** This task is included in Joint Venture's schedule with the due date of 27-MAR-15.
- **2-Oct-14:** A conference call was held with JV (including CANDU Energy), and a Level 3 schedule for the Safety Assessment was provided to OPG by early January 2015, as per the tracking of this report on the Joint Venture's schedule. Building collapse scenarios are being added to ensure that RAHM is considered in the NSA. A meeting was held on 11-Feb-2015 to discuss the plan for RAHM. It has been confirmed that RAHM collapse scenarios are included. JV is now to document its approach in the plan.

**Restart:**
- **13-Mar-15:** NSA in progress. Preliminary results are available.
- **24-Apr-15:** Date set for submission of NSA to CNSC is 24-Jun-15. NSA is on track, and not at risk. Review in progress. OPG has provided comments on one file today, with the rest planned for tomorrow.
- **6-May-15:** Meeting will be held today to resolve comments and dispositions on Methods and Assumptions, Analysis Plan, and Analysis Strategy. OPG has provided feedback on analysis and design.
- **11-Jun-15:** OPG received analysis plan (38RF-03600-PLA-001 R00) and a meeting was held on 10-Jun-15 to discuss the preliminary results.

### Summary of Actions

- **Status:** Active
- **In Progress:**
  - Complete Nuclear Safety Assessment

### Impact: Potential impact on critical path.

- **John Hamilton**
- **Peter Kempton**
- **Adam Coyle**

**Tech Tips**
- Engineering rework is defined as revised design post DEC approval. Construction rework is defined as re-installation or re-fabrication.
- 29-Jan-16: Rework means that work that is required to correct original work (or rework) that is not defective. To proactively minimize pilecap pour rework, they are now scheduled to the weekends, as any delay at the Sally Port during the weekdays will incur rework to this task.
- 19-Feb-16: To minimize potential rework/delay, the first pilecap zone pour will use 3 pump trucks, 1 station outside the PA increase one of the other 2 inside the PA fails.
- 22-Mar-16: Update to Critical Path: Zone 1 pour was executed per logistics plan and executed in 2 hours less than planned. The next 10 pours will be planned and executed in the same manner.
- 19-Mar-16: Zones 3 and 2 poured within allocated time. No rework.
- 12-May-16: Zones 4 and 5 poured within allocated time. No rework.

RWPB - Potential Conflicts in Coordination of Work (No Window Related)

Event: Schedule misalignment on Mechanical, Electrical and HVAC windows
Cause: Ineffective planning
Impact: Conflicts in coordination of these work may occur with impacts on critical path.

Active  John Hamilton  Peter Kempton  12-May-16  Mitigate  14-Apr-16  3 1 2 6 1 1 2 3

Comments
12-Jan-16: JV to develop strategy to minimize work conflict.
01-Feb-16: Strategy development in progress.
19-Feb-16: Strategy is required during later stages of construction. JV to clearly define construction tasks per CWP in P6.
22-Mar-16: Due date advanced to align with construction need date.
13-Apr-16: Development in progress with no risk to due date.
12-May-16: Development in progress with no risk to due date. Meeting Scheduled May 28 to develop.

RWPB - Retube Waste Processing Building Not Meeting Campus Plan

Event: Retube Waste Processing Building (RWPB) construction activities do not meet the requirements of the Campus Plan

Active  John Hamilton  Adam Coyle  12-May-16  Mitigate  30-Dec-16  2 2 4 1 1 1 2 3
In Progress Meet Campus Plan Requirements

3374

3374

OPG to provide oversight/assistance to Joint Venture to ensure RWPB construction activities meet the requirements as specified in NK38-REP-03610-0511563.

John Hamilton

Adam Coyle

30-Dec-16

21-Nov-15: There are 76 requirements as specified on Pages 12 to 17 of NK38-REP-03610-0511563, of which 48 are applicable to the Retube Waste Processing Building. The Joint Venture noted that NK38-REP-03610-0511563 is not a contractual document, but a reference document. Selection of the requirements for RWPB are tracked in Excel located in SharePoint at: Nuclear Projects > Nuclear Refurbishment > In-take and Feeders Replacement > 73105 > Waste > Risk Strategy > Campus Plan

3-May-15: John to obtain responses from JV on how RWPB construction activities meet these requirements. JV has been slow in responding to questions. John to update JV on review of requirements as part of the Construction meeting held weekly on Tuesday afternoon. John has been provided the campus plan requirements to JV and is to follow up with Mitch Holt on their status.

4-May-15: Reviewed Campus Plan Requirements with JV.

10-Apr-15: Reviewed Campus Plan Requirements with JV.

24-Apr-15: Ed McGurk reviewed the campus plan and provided a condensed list containing craning, material tie-down, securing and traffic concerns to JV for their input. Dan Joudrey from Aecon provided responses and a meeting is planned for Week of 27-Apr-15 to discuss.

6-May-15: OPG and Aecon met and discussed the strategy to meet each applicable campus plan requirements for RWPB. SharePoint will be updated accordingly. OPG and Aecon agree that the campus plan requirements will be re-visited 6 months from now to review how these requirements are met.

29-May-15: Documentation of how each campus plan requirements are met is on-going.

25-Jun-15: Khai Ngo to follow up with Ed McGurk on the status of the documentation.

20-Jul-15: Ed McGurk to start providing write-up on how each campus plan requirements applicable to RWPB are met.

17-Aug-15: Ed McGurk provided resolution on how some RWPB campus plan requirements are met. Khai Ngo to review and identify remaining items. The transfer corridor will also need to satisfy all applicable campus plan requirements ident

Requirements (No Window Related)

Cause: insufficient planning, review and approval of construction strategy
Impact: schedule delay and/or additional cost during the Definition Phase.

**Action Details:**

- **RWPB - Waste Tooling System (WTS) Schedule Integration (No Window Related)**
  - **Event:** Improper WTS install schedule integration in to the RWPB schedule will delay RWPB Availability date.
  - **Cause:** RWPB and WTS are two separate sub-projects under RFR. WTS install schedule delayed due to RWPB late availability requirements and integrated schedule.
  - **Impact:** RWPB Availability date

- **RWPB Engineering - FCN Process Too Long and Too Many (Not Window Related)**
  - **Event:** As a result of the Design Intent Change, FCN process may be too long for project expectations and the changes may be too many for the existing resources to handle.
  - **Cause:** Inefficient FCN process due to vendor logistics.
  - **Impact:** Delay to schedule and cost to project.

**Notes:**

- 12-Jan-16: Require 2 to 3 more weeks to hash out the details.
- 01-Feb-16: JV to produce weekly dashboard starting 10-Feb-16.
- 19-Feb-16: JV providing weekly RWPB dashboard updates.
- 22-Mar-2016: All campus plan projects are having the weekly reporting aligned with the new Weekly Project Performance Report.

### Event: Any safety incident on site may occur

- **Cause:** Ineffective risk based oversight program
- **Impact:** Delay to construction schedule and project cost

### Execution Phase

**Event:** The project schedule currently recognizes a large portion of work that requires the use of plastic suits. The transition from plastic suits to reduced required RPPE is a process that will require sustained samples which demonstrate the requirements and risk for plastic suits is no longer necessary.

**Cause:** At present this could take between three and five days of continued monitoring and surveys.

**Impact:** The schedule and the assumptions made from the project need to be aware and reflect these requirements to ensure a smooth transition with minimal delays is achievable.

### Project: Retube and Feeder Replacement - RF

**RFR Schedule assumptions for reduced RPPE (Window 23, 24, 25, 29)**

**Event:** There is a residual risks that that there will be spread of loose contamination in the RFR Waste Processing of crushed PT

**Execution Phase Risk:**

**EVENT:** There is a residual risks that that there will be spread of loose contamination in the RFR

OPG Foreign Material Exclusion (FME) Events
Concealed [Window 42, 111, 114, 115, 116, 117]
Execution Phase:
Events: FME items sitting inside Concealed Areas that cannot be discovered/identified in Walkdowns may occur during RFR work in Execution Phase. Cause: As a result of historical FME events, Impact: Additional inspection/repair activities with negative impacts to RFR cost and duration. SCR; N-2015-19073 - RFR – Lack of FME Program was filed to identify the lack of FME currently in place. For trending; N-2015-22746 - RFR Tooling shipped to DEC from manufacturer with visible Foreign Material JV will issue REV-0 of the FME plan as per the meeting on Nov 4th with planning manager - Sebastian Wojewoda. Follow-up by Gerard Edison with JV SME indicated that incorporation of comments has been completed and issue date TBD by JV. The JV will require an approved FME plan for the standby plan that has been approved and issued.

There are no Not Started, In Progress Actions associated with the risk.

14319
Processing of crushed PT (possible similar risks to EF/CT/CTI) [Window 114, 115, 116, 117]
EVENT: There is a residual risk that there will be spread of loose contamination in the RFR WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup. Cause: This risk is postulated to occur by loose contamination being spread from the PT chute that leaks the FVS press to the RWC debris cover. There is a ‘O-ring’ like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is retracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring. By design, it is expected that the ‘dirty’ pins on the WTS lidding station will become contaminated over time as they lift the debris cover. there are separate ‘clean’ pins for lifting the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern.

IMPACT: Based on OPEX with a similar WTS FVS press used at Lepreau Refurbishment - when PTs were crushed, the loose contamination led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.

There are no Not Started, In Progress Actions associated with the risk.

Risk Report by Project with Associated Actions

Project: Retube and Feeder Replacement - WA

Execution Phase Risk:

**Spread of Contamination during RFR Waste Processing of crushed PT**

Possible similar risks to EP/FT/CTI [Window 114, 115, 116, 117]

**EVENT:** There is a residual risks that that there will be spread of loose contamination in the RFR WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup.

**Causes:** This risk is postulated to occur by loose contamination being spread from the PT chute that leaks the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is extracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring.

*By design, it is expected that the 'dirty' pins on the WTS lidding station will become contaminated over time as they lift the debris cover, there are separate 'clean' pins for lifting the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of this loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern.*

**Impact:** Based on OPEX from a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose contamination led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.

---

Project: Security - Project - 25918

**Event:** There is a residual risks that that there will be spread of loose contamination in the RFR WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup. This residual risks remains despite best practices in RFR WTS design and procedures.

**Causes:** This residual risks is postulated to occur by loose contamination being spread from the PT chute that leaks the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is extracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring.

**Impact:** Based on OPEX from a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose contamination led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.

### Risk Report by Project with Associated Actions

#### Risk Event 1 – 82930

**Project: Security - Project - 82930**

- **Risk Event 1:** Vendor Resource insufficient resources. **Schedule:**
  - **Details for Risk Event 1 are stored in the project files.**
  - **Active:** Francis Davis  Silviu Olariu  21-Apr-16  Monitor  31-Jan-17  2  2  3  6  1  1  1  2  1  2

- **Risk Event 2:** There is a risk that vendor and station support resources will be limited when needed. **Schedule:**
  - **Details for Risk Event 2 are stored in the project files.**
  - **Active:** Francis Davis  Silviu Olariu  21-Apr-16  Monitor  31-Jan-17  2  2  3  6  1  1  1  2  1  2

**IMPACT:**
- Delayed Project Schedule and increased costs.
- Additional cost and schedule delay to develop/implement solutions
- Additional major mod may be required to support the layup Scope of Work. CAUSE: Detailed design uncovering new needs as design progresses. For example, draining the deadlegs in PHT Dry Air project and Moderator Rush Tract. IMPACT: Result in increased scope, schedule and cost

**CAUSE:**
- Vendor does not have sufficient qualified personnel to complete SDLU project deliverables
- Availability to support this project. This would be caused by late scheduling of resources or due to resources being pulled from the project to support NR. This could result in increased project costs and a delayed project schedule.

**Note:** There are no Not Started, In Progress Actions associated with the risk.

#### Risk Event 2 – 82930

**Project: Security - Project - 82930**

- **Risk Event 1:** There is a possibility that the design for the new system will be late which could impact the procurement of Engineering Equipment. This work is being executed during Nuclear Refurbishment which might result in resource problems. This could result in increased costs and a delayed schedule.
  - **Details for Risk Event 1 are stored in the project files.**
  - **Active:** Francis Davis  Silviu Olariu  21-Apr-16  Monitor  31-Jan-17  2  2  2  6  1  1  1  2  1  2

- **Risk Event 2:** A third party estimated was performed for this project, but there is a risk that the estimate may prove to be inaccurate. If this is the case, this could result in an increased project cost due to the requirement to obtain additional funding. Additionally, the cost could increase due to scope changes and schedule delays not accounted for in the estimate.
  - **Details for Risk Event 2 are stored in the project files.**
  - **Active:** Francis Davis  Silviu Olariu  21-Apr-16  Monitor  31-Jan-17  2  3  4  6  1  1  2  3

**IMPACT:**
- Additional effort needed due to quality issues in design and field work.
- Additional major mod may be required to support the layup Scope of Work. CAUSE: Detailed design uncovering new needs as design progresses. For example, draining the deadlegs in PHT Dry Air project and Moderator Rush Tract. IMPACT: Result in increased scope, schedule and cost

**CAUSE:**
- Human error and/or schedule pressure
- Design uncovering new needs as design progresses. For example, draining the deadlegs in PHT Dry Air project and Moderator Rush Tract. IMPACT: Result in increased scope, schedule and cost

**Note:** There are no Not Started, In Progress Actions associated with the risk.

### Project: Shutdown, Layup, Services -

**Vendor Resource constraints impacting SDLU project deliverables**

- **EVENT:** Delay in all SDLU project deliverables
  - **Details for Risk Event 2 are stored in the project files.**
  - **Active:** Andy Ireland  06-May-16  Monitor  15-Oct-16  4  2  5  10  4  2  5  10

**Quality issues in Vendor/OPG work causing issues [No Window Related]**

- **EVENT:** Additional effort needed due to quality issues in design and field work.
  - **Details for Risk Event 2 are stored in the project files.**
  - **Active:** Andy Ireland  15-Apr-16  Monitor  31-Aug-17  3  3  4  12  3  3  4  12

**Procurement of materials is delayed [No Window Related]**

- **EVENT:** Material is ordered/delivered late. CAUSE: Delays in engineering/design transit or late release of procurement funds. IMPACT: Delayed Project Schedule and increased costs.
  - **Details for Risk Event 2 are stored in the project files.**
  - **Active:** Pogman Asgarpour  06-May-16  Monitor  31-Dec-16  3  2  3  9  2  2  8

**Additional minor mods may be required to support the layup Scope of Work. CAUSE: Detailed design uncovering new needs as design progresses.**

**Procurement risk for removed component internals (Window 2, 3, 4, 8)**

- **EVENT:** Procurement of new parts for replacement is needed
- **CAUSE:** 1) Poor/inadequate storage. 2) Poor/inadequate Layup of parts taken out. 3) Obsolescence of components
- **IMPACT:** The delay of finding replacement parts (via ordering of new parts, NCR, etc.) may cause additional costs and schedule delays to refurbishment restart.

Project: Shutdown, Layup, Services - SL

RHT Aux. SDU - Dry Air Purge at risk due to Dead Legs (Window 48)

Following draining of the RHT auxiliary systems, there will be areas where liquid water is held up as stagnant legs (hereafter referred to as dead legs). The presence of dead legs will block the flow path for the dry air purge and will result in an unsuccessful shutdown layup of the auxiliary systems.

Page 1 of 1
Risk Report by Project with Associated Actions

Project: Specialized Projects - 73506

**Refurbishment Compressors/APS to support bulkhead Tie-in**

**Event:** ECR 24553 has been initiated to use the refurbishment breathing air system to install the refurbishment containment bulkhead. The ECR assumes that the breathing air compressors will be available to support bulkhead tie-in.

**Cause:** There is little room for schedule slippage as the APS data for the compressors is to be submitted in December 2016 and installation of the bulkhead begins in February 2017.

**Impact:** Delay to critical path of Refurbishment. Increased costs to expedite procurement/installation of compressors.

Project: Shutdown, Layup, Services - 73506

**New 600 lb flanges not installed in Unit 2 BO1/2**

**Event:** New 600 lb flanges will not be installed prior to installation of the wet layup skids during U2 refurbishment on BO1/BO2.

**Cause:** Based on OPEX from previous outages, WOs 2391690 and 3291692 were constantly pushed from outage to outage.

**Impact:** Will impact Costs, schedule of DMRU2 if not implemented prior to outage.

</tr>
</tbody>
</table>

### Installation Delays due to Assessment Issues [Window 64, 70]

**Event:** JV CWP’s do not address the field configurations, ITP’s and materials.

**Cause:** RFR quality of assessment is less than adequate. Impact: Poor quality assessment could lead to installation issues which would have an impact on both cost and schedule.

<table>
<thead>

<td>Feb 4, 2015: will be included in installation planning by JV. Sept. 18/15: Project is co-ordinating a vault walkdown for JV staff to verify installation methodology and any potential interference issues. A walkdown was attempted earlier in 2015, but JV staff were not given access to the specific locations required. A further walkdown is planned during Q3. Feb 2016: Project provided feedback to JV in 2015 that Vault Cooler frames can be temporarily removed to allow coil removal and replacement. JV would need to prepare a weld package to document the frame removal and re-installation. OPG has requested that this be addressed as part of the CWP preparation.</td>
</tr>
</tbody>
</table>

### Vault Cooler Scope Change [Window 64, 70]

**Event:** Station mandates that the split coil design is used for the Vault Cooler refurbishment.

**Cause:** Revised split coil design had been partially implemented in the station. Decision may be made to change over to the new design. Impact: There would be an impact on both cost and schedule if the split coil design were mandated as it would have to be processed as a project scope change.

## Risk Report by Project with Associated Actions

### SDS Interface Compatibility Issues

**Event:** SDS computer compatibility issues during installation.
- Cause: The system will be thoroughly tested prior to installation under simulated conditions but some conditions (specifically driving actual field control valves) cannot be simulated and therefore must be tested in the field.
- Impact: Both cost and schedule would be impacted by the interface compatibility issues if they arise.

<table>

**SG Demolization Activities Extended Due To Layup and Inspection Schedule (Window: 62)**

**EVENT:** EPC vendor will need to carry resources (trades and PMT) for an extended duration in order to support SG demolization activities at the end of the SG primary side maintenance window while IMS is executing work.  
**CAUSE:** Changes to the overall refurbishment schedule that are not driven by the EPC contractor.  
**IMPACT:** This could result in an extension to the baseline schedule and a significant cost increase to the project.

## Risk Report by Project with Associated Actions

### Schedule Impact to SG Primary Side Window 062 from Feeder Installation (Window 76)

**Event:** Steam Generator Primary Side Clean Window 062 is impacted by Upper Feeder Installation Window 076

**Cause:** Upper Feeder Installation Window 076 will use all/most float provided which runs to the beginning of Lower Feeder Installation Window (RFR Critical Path) and preventing the Primary Side Window 062 from commencing as suggested in Level 1 Rev B

**Impact:** The impact will mean that the Steam Generator Primary Side Window 062 will reduce/shorten in duration resulting in the scope of work to not be completed as currently scheduled or as currently budgeted. Additional shifts may be required to recover by the window finish date. Additional shifts will result in additional costs to the project. Since Steam Generator Primary Side Clean Window 062 is schedule immediately preceding Fuel Load, the impact will be to both the Steam Generator Project and return to service of the unit.

### Event: The Darlington High Pressure water pumps used for waterlancing are not available for the refurb vendor to use during the Secondary Side Window 037

**Cause:** The Waterlancing campaign during the D1711 outage is delayed

**Impact:** A delay in the start of the refurb secondary side maintenance window which will have adverse cost impact to the SG project and interfacing projects

**Inadequate Quality Control on PSC control software (Window 62)**

**EVENT:** Improper tracking of field plan and stability to monitor pressure and duration settings during primary side cleaning of the SGs.

**CAUSE:** PSC system control software not tested and controlled prior to execution.

**IMPACT:** Blasting of the same tubes more than intended and / or blasting of small radius tube regions at a higher pressure setpoint than what is qualified. This could result in tube damage.

**Status:** In Progress

**Action Description:**

- Software Validation on mockup (lost failure modes and cleaning sequence)
- Implement procedural controls for software changes/modifications prior to and during execution

**Due Date:** 05-Aug-16

**Comments:**

- There are no Not Started, In Progress Actions associated with the risk.

Steam Generator does not meet dryness criteria as requested by SNC Lavalin [Window 62]

EVENT: Steam generator does not meet the dryness criteria requested by SNC Lavalin potentially cause by OPG not providing a dry SG to the contractor.

CAUSE: Drying performed by layup contractor does not sufficiently dry the steam generator.

IMPACT: Schedule delays while waiting for additional drying to be performed. Additional costs for crews waiting for access to the SG.

Workplace congestion during refurb [Window 34, 37, 64, 104]

EVENT: Workplace congestion due to other project groups causes changes to the detailed plan for the SG project.

CAUSE: Other project groups using laydown areas assigned to the SG project. Laydown areas not properly identified by the project.

IMPACT: Delays to the project schedule and/or increased project costs.
### Materials Procured and/or Fabricated

**EVENT**: Materials procured and/or fabricated by the EPC vendor does not meet the requirements outlined in the contract agreement and purchase order. **CAUSE**: Potential causes include counterfeit or fraudulent materials, late or wrong materials, and/or materials without sufficient quality documentation. **IMPACT**: Delays in procurement activities which could result in increased execution cost and schedule delays.

### Blowdown PIPE Work Causes Delays to Refill the Boiler

**EVENT**: Work on the blowdown pipes project extends refill of boilers. **CAUSE**: Blowdown pipe project prevents SG project from draining water. **IMPACT**: Delays to the schedule and 40 day SG maintenance window may be extended.

### Extension to 40 Day SG Secondary Side Maintenance Window

**EVENT**: The maintenance window on the Secondary Side of the SGs may extend beyond the 40 day allowable duration (chemistry constraint). **CAUSE**: Due to delays in the schedule and integration with other work groups and resources (IMS, ASC Projects, Operations). **IMPACT**: The SG project will need specific approved exemption from chemistry to allow a drained blackout period. **CAUSE**: Potential causes include counterfit or fraudulent materials, late or wrong materials, and/or materials without sufficient quality documentation. **IMPACT**: Delays in procurement activities which could result in increased execution cost and schedule delays.

### Steam Generator Primary Side Clean Magnetic Collection Contamination Event

**EVENT**: Leaks contamination event during steam generator primary side clean magnetic collection. **CAUSE**: hose rupture or other issue with the contractor's primary side cleaning equipment. **IMPACT**: Delay to critical path for the SG project. A large scale contamination event could result in harm to the Steam Generators. To avoid extending beyond this timeframe, the SGs may need to be refl ed and then drained to reset the clock. This requires additional support activities and will result in schedule and cost impact to the project.

### Damage to Steam Generator Tubes During Access Port Installations

**EVENT**: Damage to steam generator tubes during access port installations. **CAUSE**: Potential causes include tool failure or human performance. **IMPACT**: Additional inspections and/or tube plugging which will impact cost and schedule of SG project. Significant network adds cost and extends the project schedule.
## Risk Report by Project with Associated Actions

### Foreign Material Entries Steam Generator-PSC

**Event:** Foreign materials are introduced into station systems during divider plate inspections, bungee install, and IMS inspections. **Cause:** Inadequate human performance, work processes and design features. **Impact:** Cost and schedule impacts for FME retrieval and/or additional tube plugging.

### IMS Holding Costs during SG Primary Side Inspections

**Event:** During the SG primary side maintenance and inspection window, IMS encounters delays in being able to execute their work. **Cause:** Delays from the predecessor primary side cleaning work or other vendor's scope (RFR, etc). **Impact:** IMS will be utilizing contract staff. IMS may incur substantial holding costs.

### Risk of Vendor Default/ Business Continuity [No Window Related]

**Event:** The risk is that the vendor is unable to meet the contractual obligations due to vendor default.

### IMS Holding Costs during SG Primary Side Inspections (Window 62)

**Event:** During the SG primary side maintenance and inspection window, IMS encounters delays in being able to execute their work. **Cause:** Delays from the predecessor primary side cleaning work or other vendor's scope (RFR, etc). **Impact:** IMS will be utilizing contract staff. IMS may incur substantial holding costs.

### Transportation of the Shielding Flask Through the Un-zoned Area [Window 62]

**EVENT:** As part of the Primary Side Clean (PSC) project, magnetite waste will be collected in a shielding flask that needs to be transferred to a trillium container. The project plans to move the full shielding flask from the station to the WFFAA outside through the un-zoned area. As part of a project meeting with the ALARA group it was identified that it may not be possible to transport the shielding flask through the un-zoned area.

**CAUSE:** Decision by RP that the flask cannot be transported through the un-zoned area.

**IMPACT:** New transportation method and / or route will need to be planned. This would lead to increased costs and potential schedule delays.

**Due Date:** 17-Jun-16
### Risk Report by Project with Associated Actions

#### Project: Turbine Generator - Turbine and Excitation Controls Software Qualification Report (SQR)

**Risk to Quality/Schedule (No Window Related)**

**EVENT:** Software Qualification Report is required prior to the FAT testing and for JV to complete all deliverables for Release 2 in March 2016. Any delay will affect the FAT testing and impact the schedule.

**CAUSE:** There are two aspects to the risk: Technical: Due to OPG specific criteria which drives the Turbine and Excitation Controls software to a higher level. Commercial: Alstom has provided OPG a preliminary gap analysis identifying the Turbine and Excitation Controls software that Alstom intend to provide Software Qualification Reports (SQR). The preliminary gap analysis also identifies software which, due to contractual difference of position, Alstom does not intend on providing SQRs for.

**IMPACT:** This can lead to schedule and cost impact on the overall project.

**SCR N-2015-10744.**

### Project: Turbine Generator - Execution impact on critical path impacting TG project (Window 6.1)

**EVENT:** The timeline of the dynamic commissioning of the TG project will be impacted due to the plant condition, emergent issues. The vendors GE and JV will have to change direction and ensure that the FSMS will fit successfully into the MCDF.

**IMPACT:** This alteration has potential for additional cost and delay to both vendors, GE and JV.

## Risk Report by Project with Associated Actions

**Risk**
- **Type**: Material delays due to incomplete documentation, wrong material or improper storage
- **Impact**: This can lead to schedule impact due to materials being unavailable
- **Cause**: Additional aspects is the residual reliability risk of the TH Crane after refurbishment. If the TH Crane experience any break down during the critical path of the TG window, cost and schedule will be negatively impacted. Also, there is a risk related to plant integration, related to any forced outages or station emergency requirements to use the cranes which may supersede TG Project needs, resulting in negative impact to cost and schedule.

**Event**
- **Project**: TG - Material delays due to incomplete documentation, wrong material or improper storage
- **Description**: Alstom may not be able to provide pedigree documentation that JV requires for completion of receipt inspection of OEM supplied materials activities in accordance with JV’s Quality Assurance Program. This can lead to materials not being released on time from the JV’s warehouse.
- **Impact**: This event can lead to schedule impact due to materials being unavailable
- **Action**
  - **Status**: Active
  - **Title**: Monitor
  - **Description**: There are no Not Started, In Progress Actions associated with the risk.
  - **Due Date**: 30-Oct-16
  - **Action Owner**: Peter Moore
  - **Delegate**: Mina Boghdady

## Risk Report by Project with Associated Actions

**Risk**
- **Type**: Lack of skilled and experienced EPC Vendor Staffing
- **Impact**: This can potentially result in adverse cost/schedule/quality impact.

**Event**
- **Project**: Lack of skilled and experienced EPC Vendor Staffing
- **Description**:Given known lack of turbine / generator experienced craft labour resources, OPG and globally, the action is to investigate potential augmenting of TG craft labour with OPG/turbine crew support and resources to participate in install/commissioning for cost/pollution of this specialty knowledge to the TG  resources, and also to assist/turbine crew in terms of hands on training to prepare for future AFS/turnover.

**Action**
- **Status**: In Progress
- **Title**: Project will conduct oral review board to assess the capability and experience of the all trades supervision.
- **Description**: There are no Not Started, In Progress Actions associated with the risk.
- **Due Date**: 12-Dec-16
- **Action Owner**: Peter Moore
- **Delegate**: Dave Owens

## Risk Report by Project with Associated Actions

**Risk**
- **Type**: TG - Risk of Schedule Delay / Cost Due to DPO and Vendor Handoffs / Dependent Activities
- **Impact**: There are no Not Started, In Progress Actions associated with the risk.

**Event**
- **Project**: TG - Risk of Schedule Delay / Cost Due to DPO and Vendor Handoffs / Dependent Activities
- **Description**: Late or incomplete handoffs, or late completed activities may result in delay or rework by other vendors or OPG groups. These contactsors are in a very high demand therefore if they are let go there is high chance we might not be able to rehire them on time. Project also might not be able to reemploy this resources on another project.

**Impact**: However the risk is there will be schedule delay or additional costs due to the multiple handoffs / dependent activities between DPO / Alstom / TG / IMS.

**Action**
- **Status**: Active
- **Title**: Monitor
- **Description**: There are no Not Started, In Progress Actions associated with the risk.
- **Due Date**: 01-Dec-16

## Risk Report by Project with Associated Actions

**Risk**
- **Type**: TG - IMS section transportation risk
- **Impact**: There are no Not Started, In Progress Actions associated with the risk.

**Event**
- **Project**: TG - IMS section transportation risk
- **Description**: As part of the TG scope of work a new generator stator mid section is being procured. The transportation of the stator mid section is currently in the EDES scope. However a risk is imposed that infrastructure upgrades (St. Mary's Cement Dock, Gravel road connection, etc.) are required to complete the stator transportation.

**Impact**: The infrastructure upgrade will impact cost.

**Action**
- **Status**: Active
- **Title**: Accept
- **Description**: There are no Not Started, In Progress Actions associated with the risk.
- **Due Date**: 01-Dec-16
- **Action Owner**: Peter Moore
- **Delegate**: R. Smith

## Risk Report by Project with Associated Actions

**Risk**
- **Type**: TG - IMS work window for TG could coincide with their blackout dates
- **Impact**: There are no Not Started, In Progress Actions associated with the risk.

**Event**
- **Project**: TG - IMS work window for TG could coincide with their blackout dates
- **Description**: IMS has been hired by the refurb organization to perform inspection on the Turbine Generator and Auxiliaries.

**Impact**: The fluidity of Refurb execution schedule is posing a risk since IMS work window for TG

**Action**
- **Status**: Active
- **Title**: Monitor
- **Description**: There are no Not Started, In Progress Actions associated with the risk.
- **Due Date**: 30-Sep-16
- **Action Owner**: Peter Moore

**Risk**
- **Type**: Alstom may not be able to provide pedigree documentation that JV requires for completion of receipt inspection of OEM supplied materials activities in accordance with JV’s Quality Assurance Program. This can lead to materials not being released on time from the JV’s warehouse.

**Event**
- **Project**: Alstom may not be able to provide pedigree documentation that JV requires for completion of receipt inspection of OEM supplied materials activities in accordance with JV’s Quality Assurance Program.
- **Description**: This risk may occur due to the OEM not following QA, improper material or quantities, or documentation missing from sub-vendors or due to human error. In addition, the risk is also JV non-compliance with storage requirements conditions of Alstom parts, resulting in parts that cannot be used, or additional analysis must be performed resulting in delays.

**Impact**: This risk may also occur due to OPG cat id documentation not being correct for future AFS/turnover.

**Action**
- **Status**: Active
- **Title**: Monitor
- **Description**: There are no Not Started, In Progress Actions associated with the risk.
- **Due Date**: 30-Oct-16
- **Action Owner**: Peter Moore
- **Delegate**: Mina Boghdady

**Risk**
- **Type**: Additional aspects is the residual reliability risk of the TH Crane after refurbishment. If the TH Crane experience any break down during the critical path of the TG window, cost and schedule will be negatively impacted. Also, there is a risk related to plant integration, related to any forced outages or station emergency requirements to use the cranes which may supersede TG Project needs, resulting in negative impact to cost and schedule.

**Event**
- **Project**: TG - Risk of Schedule Delay / Cost Due to DPO and Vendor Handoffs / Dependent Activities
- **Description**: Due to multiple vendor handoffs, the TG contacting strategy has been optimized to reflect strengths of vendors and internal OPG groups involved.

**Impact**: This can lead to schedule impact due to materials being unavailable
Risk Report by Project with Associated Actions

- **TG - New Stator Midsection replacement**
  
  **EVENT:** The TG project is procuring a new stator to be used on U3 generator from Alstom. The new stator is specified and expected to be delivered on site as a direct replacement item.
  
  **CAUSE:** There is a risk that the new stator can arrive at the Darlington site not with the right components and the design does not have the correct specification. Therefore the stator functionality and operability is not similar to the original.
  
  **IMPACT:** It will affect greatly affect the TG window risking to make it a critical path.

- **TG Risk of Schedule delay due to inefficient vendors cooperation/interface**
  
  **EVENT:** The selected vendor may not obtaining, or not obtaining on time, technical information from the ESES required to support the TG work due to lack of EPCs ability to obtain required information from ESES.
  
  **CAUSE:** Inability to answer/excessive response time RFI's from EPC.
  
  **IMPACT:** There might be schedule delay and additional cost.

- **TG Discovery work scope caused by Inspections with impact on long lead items of major repairs**
  
  **EVENT:** The risk is that parts/resources for contingent inspection based work is not readily available when needed to support TG objectives or when major repairs are required.
  
  **CAUSE:** Following inspections, material lead time is evaluated against recommended contingent work and advance schedule impact may result. (such as thyristor inspection but not including major items such as Stress Corrosion Cracking on the Turbine Rotor)
  
  **IMPACT:** It will affect greatly affect the TG window risking to make it a critical path.

- **TG - Risk of EPSCA Costs above Current Estimate**
  
  **EVENT:** In support of 4D estimating in 2014, TG implemented a variable resourcing profile for OPG requirements (deliverables) of the contract and there can be quality and level of errors on vendor's submittals to OPG for review.
  
  **IMPACT:** There is a potential delay in completing the milestone and can impact the schedule.

#### Notes:

- There are no Not Started, In Progress Actions associated with the risk.

---

Run by: [For Internal Use Only]

Page 1 of 1
This page contains a risk report discussing various project risks associated with the OPG plant. The document outlines potential issues and their impacts on cost, schedule, and equipment. Key points include:

- **Risk Assessment**: The report identifies several risks that could affect the project's progress, such as non-compliance with OPG requests, additional costs due to maintenance, and potential delays in schedule.

- **Impact**: Risks like not meeting IESO requirements can lead to additional costs and delays in schedule.

- **Recommended Actions**: The report suggests actions to mitigate these risks, including increased oversight, additional support, and improved communication with vendors.

- **Monitoring**: The document includes a section on monitoring risks, indicating that no Not Started, In Progress Actions are associated with the risk.

Overall, the report provides a comprehensive view of the project's risks and the necessary steps to manage them effectively.
Risk Report by Project with Associated Actions

Project: Turbine Generator - 73273

EVENT: The modification to be implemented, the turbine controls, excitation controls and hydraulic controls are being upgraded. This new modification will be tested during static and dynamic commissioning.

IMPACT: There is various unexpected issues that can occur during the static or dynamic commissioning from schedule window delay to the whole system not functioning or behaving as expected.

CAUSE: This can lead to a big impact on the cost, schedule and might delay the entire refurbishment of TG.

</table>

There are no Not Started, In Progress Actions associated with the risk.

Project: Turbine Generator - 73272

EVENT: The high voltage bushings and transformers haven't been replaced since installation in the original turbine generator set erection.

CAUSE: Due to this being a first of kind work, particular concern are:

1. Size/Weight, tight working space and lack of experience with the required tooling
2. CT Wiring Connections correct installation and quality control
3. HV Bushing Replacement and potential damage to spare bushing used for mock-up
4. PIP Disassembly, first time evoluation (FME, control of parts, spares, mechanical joints, broken parts).

IMPACT: Unknown factors in the replacement of high voltage bushings and transformers could impact the cost and schedule for the generator portion of TG refurbishment scope.

There are no Not Started, In Progress Actions associated with the risk.

Project: Turbine Generator - 73277

EVENT: Due to the legacy strategy of maintenance in place the LP spindles have not been removed since turbine generator set erection. The scope also requires first time complete disassembly work on the intercept valves. Of particular concern are:

1. Tooling
2. Uncoiling of turbines
3. Testing/Commissioning
4. Resource Challenges
5. Lifting Equipment
6. Procedures
7. Discovery Work
8. OPG unsuccessfully attempted to disassemble these intercept valves before.

CAUSE: This is a first of kind work conducted with a high potential for risk.

IMPACT: These tasks could involve impacts to cost/schedule if not planned adequately or executed as planned.

Project: Turbine Generator - 73279

EVENT: Removal for U2 refurbishment [WINDOW 64]

CAUSE: Due to this being a first of kind work, particular concern are:

1. Tooling
2. Uncoiling of turbines
3. Testing/Commissioning
4. Resource Challenges
5. Lifting Equipment
6. Procedures
7. Discovery Work
8. OPG unsuccessfully attempted to disassemble these intercept valves before.

CAUSE: This is a first of kind work conducted with a high potential for risk.

IMPACT: These tasks could involve impacts to cost/schedule if not planned adequately or executed as planned.

## Risk Report by Project with Associated Actions

### Project: Turbine Generator - 73032

**Event:** The generator stator is infrequently drained, and has never been vacuum dried. This will have to be completed as part of the TG refurbishment scope.

**Cause:** This is a First of Kind Work Cost, of particular concern are:
1. The lack of skilled and experienced labour.
2. The unavailability of a validated procedure due to the task's status as FOAK work.
3. Vacuum pump details/tool and process not finalized.
4. Stator winding corrosion if inadequately dried.

**Impact:** Schedule and cost impacts could result from unknown factors during the drain and dry process.

### Project: Unit Islanding - 73461

**Event:** Containment isolation work in the Fuel Handling duct could increase the critical path schedule and lead to cost overruns due to fueling requirements [Window 23, 38]

**Cause:** Reasons for no fueling windows not occurring as planned could include unit zone conditions and trolley reliability. The 3V planning basis is that any work below the 100m elevation 87% efficient for U2 BH install and drops to 50% for U2 removal and all other work on subsequent unit. This risk documents delay above and beyond the 3V planning basis.

**Impact:** If no fueling windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time. This risk is to identify project level impacts. Program risk #155 is to identify impact at the program level (i.e. critical path that affects all of MY/QUAD CHART RISK)

**Actions:**
1. Develop scope/strategy. Owner: Ross McCord TCD: 30 Sept 2015 (complete)
5. Action: Mitigate. Owner: Alex Markovsky TCD: 30 Sept 2015 (complete)

### Risk Report by Project with Associated Actions

**Event:** Shield Tank Over Protection Installation may delay Bulkhead in-service (Window 23)

**Cause:** The bulkhead cannot be put in-service until Shield Tank Over Protection has been installed on all operating units to avoid a Beyond Design Basis Accident which is beyond the Bulkhead design pressure.

**Impact:** If STOP is not installed then Unit 1 must be down 30 days prior to Bulkhead AFS.

**Risk:** The risk is that there may be insufficient time available to complete Shield Tank Over Protection mods in units 1, 3 and 4 prior to installing the Unit 2 Bulkhead.

**Solution:** The STOP mod demonstration occurs before Bulkhead Available For Service. Work Control to logic tie the refurb and D1711 outage schedules, follow up with Dennis Curley to ensure completion.

**Action:**
- **Owner:** Ross McCord
- **Status:** In Progress
- **Title:** Shield Tank Over Protection Installation Bulkhead
- **Description:** Shield Tank Over Protection installation has been moved to D1711 from D1511. Shield Tank Over Protection installation requires continuous monitoring to make sure modification occurs before Bulkhead Available For Service. Work Control to logic tie the refurb and D1711 outage schedules. Follow up with Dennis Curley to ensure completion.

**Action Decision:**
- **Owner:** Luca Mucciarone
- **Due Date:** 29-Sep-17

---

**Project: Unit Islanding - 73463**

### Containment Isolation Work in the Fuel Handling duct

**Execution Phase:**
- Event: The critical path isolation of the refuI unit from containment (bulkhead installation), and subsequent removal post fuel channel and feeder replacement, may extend beyond scheduled windows. The frequency/availability and duration of no-fuIning windows is determined by operating unit zone conditions and trolley reliability. The 3V parking basis is that any work below the 100m elevation 87% efficient for U2 BH instal and drops to 50% for U2 removal and all other work on subsequent unit. This risk documents delay above and beyond the 3V parking plans.
- Impact: If no-fuIning windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time. This risk is to identify project level impacts. Program risk 468 is to identify impact at the program level (i.e. critical path that affects all of MY/QUAD CHART RISK).

**Action:**
- Status: In Progress
- Action Title: Inject D1711 calandria pressure test
- Action Description: Review/modify AWPPs to allow working below 100m elevation under certain condition. These modified AWPPs will be supported by Fuel Handling. Current AWPPs would interrupt bulkhead installation and removal when used fuel is below “y” ron on units 1, 3 or 4 (fuIning of these units). Modified AWPPs would allow installation of BHs to continue when fuIning units 3 & 4 and also unit 1 once BH panels are in place.
- Owner: Ross McCord
- Delegate: Mike Fox
- Due Date: 28 July 2016

**Comments:**

**Risk Action:**
- In Progress: Risk Action
- Review/modify AWPPs to allow working below 100m elevation under certain condition. These modified AWPPs will be supported by Fuel Handling. Current AWPPs would interrupt bulkhead installation and removal when used fuel is below “y” ron on units 1, 3 or 4 (fueling of these units). Modified AWPPs would allow installation of BHs to continue when fueling units 3 & 4 and also unit 1 once BH panels are in place.
- Owner: Ross McCord
- Delegate: Mike Fox
- Due Date: 28 July 2016

### Containment boundary calandria seal may fail during interospace pressure test during NR outage

**Execution Phase:**
- Event: Containment boundary calandria seal may fail during interospace pressure test during NR outage. Risk may not pass initial testing and it may degrade after initial testing prior to unit refurbishment, particularly the U3 seal pressure test in D1531 did not meet test criteria.
- Cause: Seal may degrade after initial tests, requiring replacement of the seal.
- Impact: Significant scheduling impact on critical path and material costs.

**Action:**
- Status: In Progress
- Action Title: Inject D1831 calandria pressure test into scope
- Action Description: Review engineering results. If needed, Inject D1831 calandria pressure test and troubleshooting into scope.
- Owner: Luca Mucciarone
- Delegate: Alex Markovsky
- Due Date: 31 May 2016

**Comments:**
- Engineering evaluation to determine if seal leakage is acceptable as is. Preliminary results are favourable. This action will not be required once formalized.

### Inadequate Bulkhead shielding may result in work stoppages at the vault during station fuIning operations

**Execution Phase:**
- Event: Shalding may not provide adequate protection during fuIning operations resulting in work stoppages. Cause: Cause can be due to design deficiency, manufacturing deficiency, and error in modeling. Impact: Schedule delays.

**Action:**
- Status: In Progress
- Action Title: Complete assessment and develop shielding requirements.
- Action Description: Vendor to develop radiation protection “As Low As Reasonably Achievable” (ALARA) plan in conjunction with detailed design to add shielding or remove workers during fuel tiday movement. Vendor to perform sensitivity analysis to determine appropriate amount and type of shielding required.
- Owner: Alex Markovsky
- Delegate: Alex Markovsky
- Due Date: 15 June 2016

**Comments:**
- Vendor shielding assessment has been submitted. Needs to be revised by JV and accepted by OPG. Draft received.
- VP to submit walkdown report.

### Failure of Containment Boundary pressure tests resulting in critical path delays

**Execution Phase:**
- Event: Failure of Containment Boundary pressure tests resulting in critical path delays.
- Cause: The specified leak rates may not be achieved which would require the leak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested. This new boundary may contain leak paths. Also, there may be unusual system alignments during the pressure tests which may inadvertently introduce leak paths. Lastly, Unit 2 and Unit 3 permanent bulkheads could fail the commissioning pressure test causing schedule delays. Also leaking plug stops may cause leakage into PHT or increase humidity levels in the vault causing inaccurate readings.
- Impact: The specified leak rates may not be achieved which would require the leak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested.

**Action:**
- Status: In Progress
- Action Title: Complete Temporary Containment Boundary walkdowns to identify potential leak paths
- Action Description: Complete walkdowns in planned outages prior to refurbishment. Identify potential leak paths and develop a plan for executing repairs as required.
- Owner: Luca Mucciarone
- Delegate: Alex Markovsky
- Due Date: 15 May 2016

**Comments:**
- Units 1, 2 and 4 complete. Unit 3 walkdown completed in D1531. JV to submit walkdown report.

**Action:**
- Status: In Progress
- Action Title: Complete Temporary Containment Boundary walkdowns to identify potential leak paths
- Action Description: Complete walkdowns in planned outages prior to refurbishment. Identify potential leak paths and develop a plan for executing repairs as required.
- Owner: Luca Mucciarone
- Delegate: Alex Markovsky
- Due Date: 15 May 2016

**Comments:**
- Unit 3 walkdown completed in D1531. JV to submit walkdown report.
### Project: Unit Islanding - 73464

**Event:** Shielding may not provide adequate protection during fuelling operations resulting in work stoppages.

**Impact:** Significantly impacts the project schedule and material costs, as well as lead to schedule delays.

**Cause:** Seals may degrade after initial tests, requiring replacement of the seal.

**Impact:** If no fueling windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time.

**Cause:** Reasons for no fueling windows not occurring as planned could include unit zone conditions, trolley reliability and required trolley maintenance.

**Impact:** Inadequate Vault Vapour Recovery System (VVRS) will potentially delay obtaining the required humidity levels for testing and delay critical path.

Risk Report by Project with Associated Actions

During station fueling operations (Window [23])

Causes: Cause can be due to design deficiency, manufacturing deficiency, and error in modeling.
Impact: Schedule delays

2670 In Progress Complete assessment and develop shielding requirements.
Vendor to develop radiation protection "As Low As Reasonably Achievable" (ALARA) plan in conjunction with detailed design to add shielding or remove workers during fuel trolley movement. Vendor to perform sensitivity analysis to determine appropriate amount and type of shielding required.
Alex Markovsky
Alex Markovsky
15-Apr-16
Vendor shielding assessment has been submitted. Needs to be reviewed by JV and accepted by OPG. Draft received.

Failure of Containment Boundary pressure tests resulting in critical path delays (Window [23, 88])

[Execution Phase]
Event: Failure of Containment Boundary pressure tests resulting in critical path delays
Cause: The specified leak rates may not be achieved which would require the leak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested. This new boundary may contain leak paths. Also, there may be unusual system alignments during the pressure tests which may inadvertently introduce leak paths. Lastly, Unit 2 and Unit 3 permanent bulkheads could fail the commissioning pressure test causing schedule delays. Also leaking closure plugs may cause leakage into PHT or increase humidity levels in the vault causing inaccurate readings.
To EVENT: The specified leak rates may not be achieved which would require the leak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested. Impact: Schedule delays

Critical Path extension in refurb unit due to inadequate Vault Vapour Recovery System performance. (Window [23, 34])

Event: Delays to Containment Pressure tests to commission the bulkhead due to high vault humidity.
Cause: The pressure tests require low vault humidity which is obtained through efficient operation of the Vault Vapour Recovery System (VVRS). A pre-refurb project is being executed to address inadequate performance of the VVRS. This also impacts the time required to reduce tritium to allow both airlock doors open. Current unit Vault Vapour Recovery System reliability and efficiency levels are low which is currently acceptable because a common containment structure provides Vault Vapour Recovery System redundancy from other units. Installation of the containment bulkhead will eliminate the redundancy for the Refurb unit and reduce the redundancy for the operating station. Impact: Inadequate performance of the refurb unit Vault Vapour Recovery System will potentially delay obtaining the required humidity levels for testing and delay critical path

The construction island - Barriers may need to be adjusted for individual projects (Window [500])

Event: The Refurb Island barriers (which typically reside along the unit boundaries) have been designed to accommodate many lay down areas and work areas. Cause: Late identification of new areas may mean the barriers need to be adjusted. Impact: This will result in costs associated with Engineering Change revisions. If barriers can't be moved quickly, then EPC delay claims may also result.

Risk Report by Project with Associated Actions

### Project: Unit Islanding

#### Event: Design assessments performed for the design of the NR barrier projects may be impacted by the configuration with two units overlapped in refurb. E.g. fire safety assessments, NS assessments, etc.

- **Cause:** Improper assessment and assumptions made when the two units are overlapped.
- **Impact:** This will lead to additional engineering work and schedule delays.

#### Event: During Refurb, it may be determined that more robust barriers are needed to separate the construction island from the operating units.

- **Cause:** Regulatory requirements or internal project requirements.
- **Impact:** This will lead to engineering rework, additional material costs, and schedule delays.

#### Event: To anchor the material to the ground in seismic areas, bolts must be used on the stanchions.

- **Impact:** This will lead to engineering rework, additional material costs, and schedule delays.

### Project: Unit Islanding - 73469

| Run by: | For Internal Use Only | Page 1 of 1 |
## Risk Report by Project with Associated Actions

### Turnover within the project or functional support groups could cause delays to the project schedule.
- **Event:** Staff turnover of project personnel or in functional stakeholders support groups.
- **Cause:** Staff turnover is inevitable, a result of promotions, retirements, opportunities.
- **Impact:** Turnover of staff will impact the schedule of the project as the new resources are brought up to speed on the project. New functional stakeholders may not concur with decisions of their predecessors which will lead to rework within the project.

<td></td>
</tr>
</tbody>
</table>

### Refurb resources unavailable to support project execution (No Window Related)
- **Event:** Station and Corporate resources supporting islanding project execution as Refurb resources are unavailable. Several specialized resources are required to execute the islanding scope including Safety System-qualified Control Techs to perform tie ins for the Negative Pressure Containment pre-piping project. These resources may be unavailable or not duplicated in the Refurb organization.
- **Cause:** Specialized skill sets and delay in refurb functional support staffing result in the requirement to use resources from other groups in OPNG.
- **Impact:** Additional costs will be incurred to fund the support that is not available in Refurb, in addition, schedule delays may be encountered if special skill set staff is unavailable, and as gap support is obtained.

### Strategy to address nuisance alarms (particularly on Unit 1) may impact islanding scope.
- **Event:** Nuisance alarms may impact islanding scope.
- **Cause:** The strategy for addressing nuisance alarms in the control room has not yet been finalized.
- **Impact:** The outcome of the strategy may create rework for the islanding modifications, or new scope for engineering changes that are required to mask alarms that impact the running units.

### A pre-req task may not be completed before islanding work is scheduled to begin. (Window [23, 28])
- **Event:** Pre-req tasks for islanding work not completed as scheduled.
- **Cause:** Before islanding work can begin, there is pre-req work which must be completed first. Current issues affecting pre-reqs are Work Plan and field execution quality.
- **Impact:** If pre-reqs are not completed as planned, islanding work must be delayed with potential burn rate cost increases.

### Possible hoisting and/or rigging failures for the bulkheads (Window [23, 88])
- **Execution Phase:**
- **Event:** While hoisting and/or rigging the bulkheads, there is a possibility that the hoisting and/or rigging will fail.
- **Cause:** 3% hoisting and/or rigging plan might fail and 4V might not have the proper qualifications.
- **Impact:** This will impact the whole project because it is on critical path.

### A second set of bulkhead panels are not available should the 1st and 2nd unit outages overlap. (Window [23, 88])
- **Event:** A second set of bulkhead panels are not available should the 1st and 2nd unit outages overlap.
- **Cause:** The risk is that Unit 3 will come down early (see Risk 678) which may result in overlapping with Unit 2 outage and there will not be a second bulkhead available. This would require expedited procurement of a second bulkhead set. Based on overlapping of three refs-first and second outages, an economic decision (DRAS 639) has been made to postpone fabrication of a second bulkhead until it is required for overlapping of the 2nd and 3rd/refs outages.
- **Impact:** Schedule delay and material cost

Risk Report by Project with Associated Actions

**Project: Unit Islanding - 73456**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73458**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73459**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73462**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73490**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73492**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73471**

D2O Mods and NPC: Islanding Pre-req execution, vendor costs may exceed estimate [Window 598, 518, 531]

Event: This risk is to identify potential cost overruns by the execution vendor for the Negative Pressure Containment and D2O mods Pre-req work.  
Cause: Based on OPEX, vendor estimates have been increasing to complete project work. This is a result of estimate maturity once Engineering is complete, underestimation of effort required, discovery work, and integration issues.  
Impact: Funding for the two projects is part of the Islanding bundle and contingency may be required to cover additional costs.

**Project: Unit Islanding - 73472**

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

Risk Report by Project with Associated Actions

**Project: Unit Islanding - 73456**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73458**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73459**

Late identification of Islanding scope due to outage planning activities [No Window Related]

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.

**Project: Unit Islanding - 73462**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73490**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73492**

Late anchoring the airlock restraint into the floor a bolt may hit buried piping or cable [Window 8]

While anchoring the airlock restraint into the floor, a bolt may hit buried piping or cable:

- Event: While anchoring the airlock restraint into the floor a bolt may hit buried piping or cable.  
- Cause: Floor scans didn’t pick up piping or cables.  
- Impact: When the bolts to restrain the airlock are drilled into the concrete they may hit cables or piping that are embedded in the concrete which will lead to schedule delays and cost impacts as the work will be stood down and damage assessed.

**Project: Unit Islanding - 73471**

D2O Mods and NPC: Islanding Pre-req execution, vendor costs may exceed estimate [Window 598, 518, 531]

Event: This risk is to identify potential cost overruns by the execution vendor for the Negative Pressure Containment and D2O mods Pre-req work.  
Cause: Based on OPEX, vendor estimates have been increasing to complete project work. This is a result of estimate maturity once Engineering is complete, underestimation of effort required, discovery work, and integration issues.  
Impact: Funding for the two projects is part of the Islanding bundle and contingency may be required to cover additional costs.

**Project: Unit Islanding - 73472**

Event: The Nuclear Safety Outage Risk assessments, Islanding Plan Updates, or the planned cold body review may identify areas of high risk which may add unexpected scope or mitigating actions to be developed by the Islanding project.  
Cause: Late indentification of Islanding scope  
Impact: This presents a risk of late scope identification for the Islanding project. Similarly, other outage planning activities such as the work order assessing may identify scope additions for the project. This additional scope may impact upcoming milestones and project budgets.
Event: Accessibility Platform Trolley (APT) is expected to be delivered by mid December 2016 from manufacturer. The bulkhead installation is schedule for mid February 2017. If the APT is delivered on time, this leaves only 2 months to drop the APT in the vault and get the proper training. Cause: Manufacturer might miss the delivery date. Impact: If the APT is delivered late, it could significantly impact the schedule (on critical path) since the bulkheads can’t be installed unless the APT is in.

**Program: Contract Management**

**Refrishment Major Contracts Increase in Scope of Work**

The risk is that Contract Management may be insufficiently resourced during project execution to deal with new and emergent Contract Management Activities including increased oversight requirements not accounted for during planning process. This could lead to formal claims, impact OPG vendor relationships, increased cost and schedule delays, etc.

Contract Management is currently procuring a Contract Management Support Services to provide support in the above areas. A PO is expected to be awarded in late Q2 or early Q3 2016.

Scope Increase for Entrainment and Benthic Invertebrate Community Study & Entrainment and Benthic Invertebrate Community Study

Effluent Characterization: It is a CNSC commitment that the Effluent Characterization study be completed and used in the updated ON Environmental Risk Assessment, which is to be submitted to the CNSC by the end of 2016. The sampling plan for the effluent characterization has been reviewed and accepted by the CNSC. If this funding is not approved, we will not meet the CNSC commitment.

Entrainment and Benthic Invertebrate Community Study: OPG has committed to the CNSC and other regulators to confirm findings discussed in the DNGS EA for refurbishment and continued operations by implementing follow-up monitoring program (FUMP) which includes the entrainment and benthic invertebrate Community Studies and associated aquatic sampling work that must be completed prior to the start of Refurbishment. Two reports must be submitted to the CNSC at the end of 2016 and one or more CNSC meetings will occur during the course of 2017 to address the additional monitoring required for the Fisheries Authorization. Sample results may result in additional sampling being required.

Potential Impact: Delay in meeting the CNSC commitment.

The risk is that the licensing fees are expected to be higher than projected in the 4c release estimate. The release estimate uses the 2014 CNSC projected costs for Darlington, and for Refurbishment, and assumes future increases over the life of the project remain constant at the 1.5% year over year increase projected for CNSC fiscal 2015/2016 and 2016/2017. The 2015 CNSC projected costs for Darlington and for refurbishment are due in early May. This risk will be updated at that time as required.

The risk is that the many steps in the process are typically built upon previously identified process short-comings, and failure to rigorously execute each step may lead to re-work, for example failure to rigorously complete system health/component health report research, failure to complete an effective COMs meeting, failure to complete a meaningful OPEX search, and failure to identify and address issues in the Task Tracking file (ITF) may lead to an inadequate design. The inadequate design may not be fully released until the point of installation/execution, at which time re-work, cost overruns or schedule delays may occur.

The risk is that there is a large amount of discovery work encountered in the valve replacement program resulting in cost impacts and schedule delays to the planned valve replacement schedule. This is caused by limitations in the ability to examine/inspect valves internals prior to refurbishments, validation of internal components and associated trade workers for execution of Refurbishment.

The risk is that the licensing fees are expected to be higher than projected in the 4c release estimate. The release estimate uses the 2014 CNSC projected costs for Darlington, and for Refurbishment, and assumes future increases over the life of the project remain constant at the 1.5% year over year increase projected for CNSC fiscal 2015/2016 and 2016/2017. The 2015 CNSC projected costs for Darlington and for refurbishment are due in early May. This risk will be updated at that time as required.

The risk is that the 5 Safety Improvement Opportunity Projects (SIOs), which are a regulatory requirement to complete prior to starting refurbishment, are not complete and appropriate contingency plans to progress the Unit 2 refurbishment cannot be developed and negotiated with the CNSC, resulting in delays to Unit 2 execution and consumption of all the schedule contingency duration for on Unit 2.

The risk is that less than adequate engineering proficiency by OPG or vendors results in quality issues or technical errors impacting works for execution of Refurbishment.

## Discovery and Emerging Work Impacting Engineering

During inspections or detailed reviews of tasks it is possible that new work will be identified and will require Engineering support. It is expected that discovery work will be found during refurbishment outage and other IIP related work. The causes may be varied but centered around either inspections or re evaluation based on operation.

### Proficiency

**Proficiency**
The action is to formalize the requirement for monitoring and managing OPG and Vendor proficiencies by developing and implementing a report card. Reference AR 28184215-04, 5, 6.

The proficiency scorecard has been developed and has been sent out to vendors and internally in OPG for feedback and comments by May 18, 2016. The feedback received from the vendor partners and OPG will be examined and incorporated into the scorecard as necessary. May 13, 2016 S. Makahlah

### Action

**OPG**

- OPG is on track for substantial completion of Engineering by the August 2015 milestones.
- Engineering for the Beaf & Ferder Refurbishment and Stabilization Project, which represents ~75% of all direct execution phase work, is nearly 60% complete.
- Detailed schedule and performance metrics are in place. Engineering is performed in accordance with OP and the contractor’s quality programs, and follows a rigorous change control process.
- A program level Engineering quality dashboard is being implemented.
- Engineering is done under nuclear industry level practice processes developed by the industry over many years.
- Engineering processes are regularly reviewed and assessed, including WANO.
- We are not re-designing the plant.
- We are not re-engineering the plant.
- We have the feed for a design change, e.g. large regulatory.
- We follow established process, e.g. how many modifications and design changes, at a system level, are being made.
- Separate new facilities/systems, e.g. ISRs and complexes, from other design changes.
- Bring out the point about the risk based approach that's implemented.
- OPG and each of OPG’s primary vendor:

**Software Quality not fully implemented leading to delays in acceptance**

Software Quality not fully implemented may be caused by:

- Incorrect Software categorization;
- Incorrect or incomplete Software QA program, development or testing.

Risk Report by Project with Associated Actions

**Testing or AR’s**

Lack of documentation (e.g. Software verification, software maintenance plan etc.)
These can delay the acceptance of the software EC package(s), delay in fully test the software systems, conformance / exceptions for missing/missed software processes and delay in commissioning and AFS of modification.

**Resource Risk for Unit RTLS, Commissioning and Close-Out**

The risk is that there are not enough Systems and Components Engineering resources for the following phases of the project:
1. Execution readiness preparations (i.e. OMP review/approval, Workplan preparation, Holds assessment and removal, TMAR review, Procedure review and approval, etc.)
2. Unit Return to Service (RTS) (i.e. Restart specifications and Workplan preparation/execution, etc.)
3. Commissioning (i.e. commissioning report preparation/approval, commissioning Workplan preparation/execution, etc.)

This is primarily due to major milestone/delivery changes (i.e. removal of segmented documentation & holds removal milestones), as well as, incrementally higher resource demands during the overlap of subsequent outages which delay the project execution.
The cause of this may be inadequacy of appropriately trained staff in terms of numbers or Money available to add FTES that may be available to complete the work in a timely way.

**New Scope for Modification added to Refurbishment Project**

During detailed assessing and schedule development it is possible for alternative support supplies (electrical, water, air) to be identified.
Past experience & unit outages has typically identified these requirements well after the milestones for design complete and often continues through out the outage.
The impact is the resource in Design Engineering and Project Support to cope with the additional demand.

**Vacuum dry slower than expected**

This is the that the vacuum dry of the heat transport system is slower than expected, caused by inadequate design or implementation challenges resulting in cost increase/schedule to the refurb program.

**Impact of Discovery work during execution of IIP**

The risk is that OPG may not be able to complete a number of IIP commitments classified as Acceptable Deviations.
The risk covers a number of IIP commitments that involve inspection of systems, concessions / exceptions for missing/missed software processes and delay in commissioning and AFS of modification.

**RHT Pressure restricted to below 6 Mpa**

The risk is that the primary heat transport system pressure is restricted to below 6 MPa due to continued use of current operation envelope designed for aged pressure tube, resulting in (cost increase/schedule delays/operating condition, increased operations, production, or safety risk during operation/other) to the (station, project bundle, refurb program).

**Program: Engineering - FN**

The original estimate for the Environmental Assessment (EA) follow up program elements was based on preliminary understanding of the commitments presented in the EA. Recent negotiations with the CNSC on the EIR/ent Characterization and Entrainment and Benthic Invertebrate Community Studies resulted in expansion of the scope of work. Negotiations with the regulator is ongoing for the other sampling plans and may impact other EA follow up program elements. The impact of this risk is increased scope, increased cost and delays in schedule.

Risk Report by Project with Associated Actions

1. Vendor Performance and Inexperience Managing their CA Programs
   - EVENT: Vendor or OPG Poor Performance requiring additional oversight resources. OPG has increased number of SCR’s requiring additional OBU Resources from Corrective Action Control Group. IMPACT: Impact would be to conduct additional oversight surveillances to identify and correct the problems and potential delays to field work.

2. Program: Managed Systems Oversight - 10000
   - EVENT: Increased number of SCR’s requiring additional OBU Resources from Corrective Action Control Group. IMPACT: Impact would be to conduct additional oversight surveillances to identify and correct the problems and potential delays to field work.

3. Program: Operations and Maintenance -
   - EVENT: Return to Service funding does not support RTS operating as a project. RTS is currently set-up as a functional support group. Funding is to provide oversight of the RTS process with work being completed by other groups such as operations, maintenance, engineering and chemistry. During the RTS process, modifications are required to support evolutions such as hot runs.
Risk Report by Project with Associated Actions

Breaker Open Milestone at Risk due to the lack of required deliverables received by Ops and Mtc

Event: TPAR Milestone was missed and Vendors were given an additional 2 1/2 months to complete. Other TPAR milestones are not adjusted. O&M deliverables affected are TCR-FAR/Training Packages, Turnover Plans/TPARs.

Causes: Originally the TPAR milestone was Oct 2015, one year prior to Breaker Open. This gave O&M 12 months to prepare for refurbishment shutdown. Design was late and Milestone was re-adjusted and split up and now due February, giving only 9 months for O&M to complete their required work. Vendors couldn't make that Milestone so Projects gave them an additional 2 1/2 months, giving only 6 1/2 months for O&M to do the same work we had planned and said we needed 12 months.

Impact - O&M deliverable for TPARs, TCR-FARs, Training packages and turnover plans are delayed for O&M to do the same work we had planned and said we needed 12 months.

DRAS is ready for M. Allen signature. It will then go to PSRB for review and acceptance. Following PSRB, a project bundle will be assigned for the hot conditioning process. Nov 30, 2015

January 6, 2016: DRAS is signed and bundle assignment for the next PSRB.

Jan 11: Action owner requested a project bundle to be assigned the scope. Issue is to be presented to Mike Allen for bundle assignment.

Jan 15 - due date moved to reflect PSRB bundle assignment with Mike Allen.

Feb 23 - due date moved, RTS is considering the efficiency of creating a new project versus using the infrastructure of a current project.

Mike Allen/Boris Vulanovic to make the final decision. New due date to reflect time for review.

March 6/2016: CCF initiated for RTS to become a project by hiring a PM and an MTL. Closure of this action will be done on acceptance of CCB and funds allocated.

March 15, CCF ready but not being presented until April CCB. Risk#804 initiated.

Apr. 04/2016 updated by A. Kalafatis: CCF now being presented at May CCB. Due date moved to May 15/2016.

DRAS is ready for M. Allen signature. It will then go to PSRB for review and acceptance. Following PSRB, a project bundle will be assigned for the hot conditioning process. Nov 30, 2015

January 6, 2016: DRAS is signed and bundle assignment for the next PSRB.

Jan 11: Action owner requested a project bundle to be assigned the scope. Issue is to be presented to Mike Allen for bundle assignment.

Valve Program Vendor Contract not Secured

Event: Currently the Work Control department is creating a valve schedule. Schedule changes are very likely once Vendor is chosen. Resources required is not possible until figures are provided.

Currently, there is no established strategy to execute the Valve Maintenance program for Unit 2. This
Risk Report by Project with Associated Actions

---

**Risks**

1. **Materials budget for emergent break-fix maintenance and scope growth during Shutdown, Layup and Runup.**
   - Event: Materials required for break-fix maintenance and scope growth during Shutdown, Layup and Runup Phases is not in MTCE Budget.
   - Cause: Contingency funds not included in business planning process.
   - Potential impact: Unable to repair, required for start up equipment, affecting critical path duration.

2. **The Cyclic Maintenance budget may not have enough funds.**
   - Event: An independent review of the Cyclic Maintenance Budget confirmed there will be a shortfall of funds assigned to the D1621 work Program associated with Shutdown Maintenance cyclic work orders. This work is part of the Equipment Reliability Index target that will be committed to for the return to service of Unit 2.
   - Cause: Initial budget assigned to cyclical overflow was estimated at $78M per unit. Present budget is $34M. Estimates received to date from Vendors are totaling $51M.
   - Potential impact: Shortfall of funds impacting RTS of unit 2.

3. **Materials budget for emergent broke-fix maintenance and scope growth during Shutdown, Layup and Runup is not included in MTCE budget.**
   - Event: Materials required for broke-fix maintenance and scope growth during Shutdown, Layup and Runup is not included in MTCE budget.
   - Cause: Contingency funds not included in business planning process.
   - Potential impacts: Unable to repair, required for start up equipment, affecting critical path duration.

### Insufficient Qualified Radiation Protection Coordinators (RTU) to Support Execution

**Event:** Insufficient number of qualified Radiation Protection Coordinators (RPCs) to successfully provide service protection oversight for radiological work performed by EPC contractors. Cause: due to low numbers of currently qualified Trades RPCs plus attrition and insufficient training and qualification of new Trades RPCs prior to execution of Refurbishment activities and opportunities with other industrial project in the province. Impact: may lead to schedule delays and cost overruns or could cause RP events due to lack of oversight or lack of properly experienced oversight.

### Transition/Transfer Plan commitments not met (Ops & Mtce Readiness)

**Event:** Refurbishment may not have sufficient Ops and Mtce resources to execute pre-requisite milestones deliverables (e.g. assessing, procedures, permitry, strategic plans, licensing) as well as field staff to execute pre-requisite field work for O1621 and D1614. NKB8-PLAN-09701-10113 SHL OPS-01 Operations Ownership Transfer Plan and NKB8-PLAN-09701-10113 SHL OPS-01 Maintenance Ownership Transfer Plan require additional details and clarification on roles and accountabilities of both site and refurb organizations. This includes the plan for transition of staff from Darlington to Refurbishment for both preparation and execution phases of the project.

**Impact:** A comprehensive review of the state of Readiness of Ops & Mtce is required to ensure metrics are in place, strategic plans are progressing and resources are being applied for success.

### Fault Projects Window (OP & Mtce working opportunities)

**Event:** Event: There is the possibility of extending the working window availability by 25 days in Window 104. This is the period of time during the Dummy FB Removal and PT Sever. No work is currently being scheduled due to lack of clarity on the RP rules required for such work. This needs to be resolved to allow maximum use of this near critical path work window.

### Identifying priority for staff within our BTU Project ranks and staff assigned to BTU Refurbishment

**Event:** A risk was raised to ensure we have documented direction and planning for staff who are assigned Refurb when non routine events occur. The risk identified includes (but is not limited to) response to IPG events, response to events within the refurb project but outside of our U2 island, various facility events and work priorities during significant competing projects (such as an outage).

### Availability of O&M Staff for Station and Refurbishment Support

**Event:** Insufficient authorized staff (Certified Authorized Nuclear Operator (CANO), Control Room Shift Supervisors (CRSS) and Shift Managers (SM)) to staff (2013 >2020) to support Operations (outage, On-line work (IPG), Emergency Work (FIN)), Technical Procedures Team it requires experienced Operations and Maintenance Staff previously employed by OPG. They have to be knowledgeable of System and Change process for Technical Procedures owned by O&M. HR AUGSTAFF group can only reach out to our Preferred Vendors (CPUS, CTSNA and Ian Martin). The Jobs have gone out to the agencies to advertise for several months. The staffing plan was to have 2 OPs and 2 Mtce staff ready for Training and field staff to be successfully in Layup and Islanding of Unit 2.

For Internal Use Only

---

**Run by:**

**For Internal Use Only**

Page 1 of 1
Risk Report by Project with Associated Actions

- Dynamic system changes will occur during refurbishment. Ensuring we have the monitoring in place during these changes will ensure we do not create unintended risk to staff and other work due to increased hazards. This is a learning event from the End Shield Cooling drain during 2014. For refurbishment, the critical risk is to identify significant changes to systems the appropriate type and frequency of monitoring PRIOR to the change execution so RP and associated organizations can validate assumptions for intended impact. In some cases, systems will be drained as a first time activity. Regardless, any reduction in shielding or introduction of unsurveyed internals needs to be identified and mitigating actions in place.

- Remediation Plan (Plan B) For refurbishment, key positions are being filled by Darlington previously licensed contract staff. Plan B requires that augmented staff previously licensed at other CANDU stations be used where necessary. Although this strategy is not optimal it partly mitigates the shortfall as a larger pool of previously licensed staff is available for use in the refurbishment phase. This strategy may need to be extended into the execution phase of the refurbishment project. An agreement is in place between the station, training and refurb non-licensed staff) to support refuel and recovery plan. The 18 month minimum to qualify an individual. Impact: This has the potential to impact on refurbishment planning and execution, Unit outages and VWO durations, efficiency of FIN and IPG, support for Authorization Training and backlogs in Ops Procedure.

- In Progress
  - Action# Status Action Title Action Description Owner Delegate Due Date
  - 3 Active Boris Vulanovic Roger Daly 10-May-16 Monitor 31-Aug-16
  - 5396 In Progress Implement a lab readiness plan
    - Implement a lab readiness plan that will bring the laboratory into position to support refurbishment earlier than breaker open. The plan would involve a regular meeting where areas that are being tracked are discussed and work down curves are presented where applicable. Items that are currently deemed at risk include:
      1. Hiring to address increased attrition expected.
      2. Training program for Refurbishment Unit access (health and safety training) and refurbishment sampling (From shut down to RTS)
      3. Instrument commissioning
    - Roger Daly Emily Coutu 14-Sep-16

- Evaluate hazard impact during changing system configurations and status during refurbishment.

- Chemistry Laboratory Support
  - Event: A Chem. Lab technician (1 FTE) was to be assigned from January 2015 to support the Unit Chemistry/Technical section. This didn't materialize as planned. Starting on May 20th the lab was expected to release someone to support refurbishment 2 days per week. This support has not been received consistently. Cause: Currently there is a shortage of resources due to some staff members being on a long term absence from work and due to the time lag associated with hiring a new technician following a retirement. In addition there are at least 7 staff members who are eligible to retire by the end of 2016. It takes 18 months minimum to qualify an individual. Impact: In Progress
    - Action# Status Action Title Action Description Owner Delegate Due Date
    - 12824/ 14726/ 15220/ 15604/ 15991/ 17416/ 17597/ 18693/ 29981/ 30018/ 30137

- Risk 677 - action 12 to mitigate the effects on critical path due to the lack of certified staff

- Support plans and rational for use by Field staff to better understand the project goals.

- The scope of work will maintain floor plans, system window timelines, RF, day in the life expectations as well as critical fundamental reference items for everyday use as well as context for briefing by RP personnel.

- Remediation Plan (Plan B) For refurbishment, key positions are being filled by Darlington previously licensed contract staff. Plan B requires that augmented staff previously licensed at other CANDU stations be used where necessary. Although this strategy is not optimal it partly mitigates the shortfall as a larger pool of previously licensed staff is available for use in the refurbishment phase. This strategy may need to be extended into the execution phase of the refurbishment project. An agreement is in place between the station, training and refurb non-licensed staff) to support refuel and recovery plan. The 18 month minimum to qualify an individual. Impact: This has the potential to impact on refurbishment planning and execution, Unit outages and VWO durations, efficiency of FIN and IPG, support for Authorization Training and backlogs in Ops Procedure.
# Risk Report by Project with Associated Actions

**Present ERT mincomp plan does not accommodate for and Islanded Unit while meeting adequate response time to potential emergent events**

Event: ON Refurbishment organization is obliged to comply with fire protection regulatory standards. Darlingtons present ERT mincomp plan does not accommodate for and Islanded Unit while meeting adequate response time for potential emergent issues.

- **Cause:** A safety event that required ERT to respond either on Islanded Unit or Station. Other work requiring ERT to respond in the event of an emergency will be required to stop until ERT able to respond. eg. hot work, high angle rescue, confined space
- **Potential impact:** All work requiring ERT response to safety issue will stop if ERTs are required to attend to another event.

**Acute Tritium release above associated west stairs**

Owing to the frequently changing nature of vault gamma beams, secure access and egress routes to vault work on the upper elevations is problematic. Coordination of work in windows with safe access paths in a manner those does not impact the RFR joint venture, and thus delay critical path, may prove unmanageable. Additionally, analysis of the risk of an unplanned exposure may conclude that it is appropriate in terms of ALARA planning to provide this safe access route. The risk is that a decision will be made to install a shielding modification that is not covered in current program cost projections.

**Acquisition, management, deployment and Storage of Contamination Control Equipment**

Ownership and Control of HEPA units, Vacuums, and Munter Tritium scrubbers during refurbishment is not clear. At present, there is no program which describes the purchase, management, storage and use of semi-portable equipment required to ensure effective contamination control will be available and maintained on the project. This risk may include components of the plan to install the large Hunter units in the vault however, the risk is raised to account for the other equipment expected to be needed during refurbishment activities.

**Acute Tritium release above Station III. During NR Primary Side Drain and Dry Operation**

Event: Potential to have an acute Tritium Emission that exceeds the Station Internal Investigation Limit (IIL) for tritium emissions during the NR startup, particularly during Moderator and Heat Transport system draining and drying steps. Cause: High tritium inventory in Moderator System, ineffective drying capacity from skids, poor condition of Vault Vapor Recovery Dryers or insufficient focus on Spills and Leaks. Potential Impacts: Could delay work due to dried or spilled problem or increased ventilation. - Unfavorable Public Relations if high emissions persist and if insufficient preparation done ahead of time to mitigate.

**Large Potential Worker Doses due to Inadequate Internal (Alpha etc.) Hazard Characterization and Management**

Event: Nuclear Refurbishment employees or contractors are exposed to unexpected radionuclides which leads to significant dose assignment. Cause: Source term characterization was inadequate and thus radiological work planning, protective actions and dosimetry requirements did not properly protect workers from the hazards presented. Impact: Potentially high doses that could exceed CNSC dose limits or CNSC dose limits, as well as a deviation to Nuclear Refurbishment work regulations, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment. Risk still closed to this risk, (SV)

### 5877 Not Started  
**Confirm Alpha Level III classification with U2 Smears**
- Section 2.2: Based on current source term knowledge, some areas where open work on contaminated HT system components is being done may fall into the Alpha Level III classification. Therefore the requirements for work as described in N-INS-09071-10013 should be implemented for those areas. The classification level should be confirmed on an ongoing basis with Unit 2 alpha characterization smears analyzed by the iSolo.  
**TCD:** March 1, 2016  
**Johnathon Hasn**  
**Scott Stafford**  
**30-Jun-16**

### 5879 In Progress  
**Test ICP-MS Method to Identify the presence of hard to detect Radionuclides**
- Section 2.2: Test the method of ICP-MS on Unit 3 outage samples to identify all potential radionuclides (especially those that are hard to detect). The ICP-MS method will identify all stable elements and their isotopes and then calculating the relative activity of the corresponding activation products knowing the absorption cross-section and neutron flux. This will provide assurance that all the hard to detect radionuclides (even those for which a radio-analytical or dosimetry method is not available) are identified and quantified. This will also assist in developing activity ratios for all hard to detect radionuclides for the purpose of dosimetry assessment and contamination monitoring. If the potential dose for the hard to detect radionuclides is high or surrogates are not available, the ICP-MS method will indicate that a radio-analytical method (assuming there is none yet in place) for the hard to detect radionuclide should be developed for dosimetry and contamination monitoring.  
**Johnathon Hasn**  
**Scott Stafford**  
**02-Sep-16**

### 5880 In Progress  
**Define the policy for PAS sampling usage during U2 Refurbishment**
- **a) Dosimetry**
  - Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).  
**Johnathon Hasn**  
**Scott Stafford**  
**30-Jun-16**  
**recommendations from external report are being reviewed for path forward.**

### 5881 Not Started  
**Define and Implement a confirmatory Dosimetry Monitoring Program for Alpha Emitting Radionuclides**
- Section 3.2: Define and implement a confirmatory dosimetry monitoring program for alpha emitting radionuclides. This will consist of a sampling of individuals who are involved on alpha hazard work as part of the Unit 2 Refurbishment. The sampling will include the submission of fecal and urine samples followed by radio-analytical analysis by an outside laboratory. This will require identification of activities and workers selected for participation as well as the infrastructure to implement this (i.e., sampling kits, recording, lab analysis, calculation of dose, and communication with workers). One option to consider is to pre-select workers and have them submit baseline bioassay samples before work begins.  
**TCD:** October 1, 2016  
**Johnathon Hasn**  
**Scott Stafford**  
**15-Sep-16**

  Scott Stafford  
  30-Sep-16

### 5890 Not Started: Shielding for WBM at U2 and RWPB

- Sect 4.4.1: Shielding for WBM at Unit 2 and RWPB should be considered and implemented if the background levels are too high for the monitors to operate effectively.  
  TCD: October 1, 2016  
  Johnathon Hash  
  Scott Stafford  
  30-Sep-16

### 5891 In Progress: Contamination Control Initiatives for RFR, RWPD and SGs

- Sect 5.1: RP should review in detail the refreshment work (e.g., CWPs for RFR in vault and RWPB, and SG work) for opportunities to reduce and control contamination spread and protection of workers against internal hazards. The outcome of this review should be documented and communicated to the Field group, HP assessors, project leaders, and REP preparers. The output from this review should be incorporated in the CWPs.  
  TCD: May 1, 2016  
  Johnathon Hash  
  Scott Stafford  
  30-Jun-16

---

The action has been assigned to the Senior Health Physicist for NR RP and he will be working with the Health Physics department at HPD to determine if the Small Article Monitor (SAM) will adequately limit the release of alpha contamination and if it should be used for that application. An update will be provided by 3 March 2016.  

**Tech Tips**

**Summary**

The small article monitors will limit the release of alpha contamination present in most isotope mixes found in the station. Isotope mixes not guaranteed to trigger a SAM alarm have been identified in a small number of characterization surveys. Areas or systems known or suspected to contain this type of contamination are identified as Alpha Level 3 and subjected to enhanced monitoring requirements specific to the hazard. These requirements are sufficient to meet contamination control objectives without relying on SAM alarms.  

**Details:** As a gamma sensitive instrument that is not capable of detecting alpha particles, the SAM is not intended for alpha contamination monitoring. Any ability to limit the release of alpha contamination would be dependent on the relative abundance of gamma emitters in the contamination mix.  

Based on discussions with HPD and a review of our source term data, it has been concluded that for most isotope mixes, the level of gamma activity is sufficient to trigger a SAM alarm for alpha levels below corporate release limits. However, this is not guaranteed for all possible isotope mixes. While a SAM does provide an additional barrier against the release of alpha contamination, it is not solely relied upon for this purpose. This is currently reflected in the design and execution of OPG contamination control process. In particular, areas or systems identified as having source terms with relatively large alpha components (i.e., alpha level 2 or 3) are subjected to an enhanced level of monitoring specific to the detection of alpha contamination. In addition, tools and equipment removed from the radiolo...

<td>Sect 5.1: Confirm who is procuring/deploying/controlling contamination control equipment (e.g., vacuum cleaners with HEPA filters) for all refurbishment projects (e.g., RFR, SG, and BOP work). Met with external vendor to confirm scope of purchased services regarding Munter. External review commissioned for review of recommendations for HEPA use on the project. TCD - July 2016.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

23 Feb. 16

A list of contamination control equipment and the TCD for arrival of the equipment on site has been requested of RFR. A list of contamination control equipment for Balance of Plant and SG work has been requested. All other information remains unchanged.

The ownership for procurement/deployment and control of contamination control equipment among the Projects is under investigation. RFR has indicated that they are responsible for procurement of five (5) smooth bore hose HEPA vacuum cleaners; 2 - for the reactor vault, 1 for the reactor auxiliary bay and 2 for the RWPB. Arrangements will be made to assist RFR with the deployment and control of the vacuums as per the Radiation Protection Coordinator assigned to the specific task.

Ownership of contamination control equipment for Balance of Plant and SG work is currently in progress and an update will be provided before 23 Feb. 2106.

It has been determined that the Radiation Protection work group does not have ownership for procurement of additional contamination control equipment. The Radiation Protection department will assist with the deployment and control of "contaminated" equipment used on the projects under the guidance of the Radiation Protection Coordinators. RP may consider purchase of some equipment. Currently no CCF has been initiated however it is under review.

<td></td>
<td>Sect 5.1: RP should consider the requirements for ventilated tents and exhaust HEPA filters. This will include the design and integrity testing.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

RP for Refurbishment has considered the use of ventilated tents and exhaust HEPA units with filters. RP will utilize ISG-02420-10095 on Use and Maintenance of Portable HEPA filter ventilation units for all hepa units used in association with vented tents. RP Refurbishment has agreed to perform the HEPA filter changes required for effective operation of the unit(s). RP Refurbishment will not purchase the HEPA units, nor does RP have budget to procure the HEPA units as this part of the "consumable" budget was given to Maintenance Refurbishment. Ventilated tents are used to control contamination, however, there is no integrity testing procedure to date, other than the use of a smoke bomb to check the tent for air flow. An alternate source of testing tent integrity would be to use a Magnehelic gauge to determine air flow. A process/procedure to perform integrity testing of tented material needs to be generated.
### Inadequate D2O Storage Capacity to Accommodate Refurb Requirements

**Event:** Insufficient D2O storage capacity due to late completion of new D2O Storage Project (14-1155S) will result in possible delay to the load and drain strategy and may require a deviation from the approved de-tritiation strategy for refurb.

**Cause:** Late completion of the new Heavy Water Management Building due to unforeseen construction difficulties

**Impact:** Potential delay to the execution schedule if storage capability is not local and immediately available when required by the scheduled draining of the moderator and heat transport systems.

<td>29-Jul-16</td>
<td></td>
</tr>
</tbody>
</table>

**Mitigation of Risk to Darlington Refurbishment Options:**

1. Review of D2O Storage Project schedule and risks to determine what OPG support may be required to ensure the EPC vendor meets the APS date (engaging with D2O Storage Building project management team). Within the Refurbishment window, immediate transport of drained moderator and/or PHT D2O to offsite storage (i.e. Pickering) with simultaneous drumming due to limited offsite storage. A significant outage delay may result.

2. Develop an alternative strategy to negate the requirement for a D2O swap and go instead to a bulk swap volume. This volume of low currie low isotopic D2O that needs to be handled by the upgrader once the flush is completed. It is unknown at this time what affect this might have on cost and schedule. Meetings and strategy planning are underway with a mid-May target to have this alternate strategy prepared and presented to take the place of the approved bulk swap strategy. This vendor to improve on the AFS date for the new D2O storage building. Risk item 676 has been updated to reflect specific actions that are being taken to improve on the APS date a drop dead date has been set that if the project milestone is not met than the alternate storage strategy will be put in place.

3. Strategy planning is underway to have a drain and flush strategy prepared and presented to take the place of the approved bulk swap strategy. This has become necessary since performance issues at the TRF threaten to prevent the development of the bulk swap volume.

**Due:** SDLU project will complete the Hazard Analysis and Dose Assessment reports at the beginning of October with OPG Nuclear Safety focused support. Any further work will be suspended and contingencies released funds will be returned to the program from SDLU.

**Results:**

- OPG projects is working aggressively with the EPC vendor to improve on the APS date for the new D2O storage building. Risk item 676 has been updated to reflect specific actions that are being taken to improve on the APS date a drop dead date has been set that if the project milestone is not met than the alternate storage strategy will be put in place.

- An EC is being developed in parallel to address the offsite or alternate storage strategies. The contents of reviewing the MDR for a storage pad to be located east of the V/B which could store up to 40 D2O type double walled containers. This MDR is being prepared and will be issued if the milestones in item 1 above is not met. A hazards assessment study is underway to verify required container specifications. ROC decision has been made (see below) to cancel the D2O Alternate Storage DSR # TS2580-1 (DRAS in progress).

**Comments:**

1. [Re-Filed: 2017-02-10, EB-2016-0152]
Risk Report by Project with Associated Actions

Initial vault crane maintenance

Event: Maintenance strategy for initial vault crane maintenance (on critical path immediately after Refurb) has not been solidified. Consideration is being made for use of external contractors but this presents a schedule risk for FOAK work in plastics, in the vault. The conflict with using OM station resources is placement of 017111 outage. Present plans has the 017111 outage pushed back by 4 weeks so there will be no competition for resources.

2 Active Boris Vulanovic Dan Cowley 10-May-16 Mitigate 30-Nov-16 1 1 3 1 1 3

Chemistry Control Procedural Review Risk

Event: Due to a short period of time from design been complete (Aug 2015) and where required documentation (Chemistry Control OM and Chemistry Lab Procedures) is needed (Aug 2016) the completed documentation being ready in time is at risk. Also, there will be required reviews on O&M documentation during the same time frame. This will be a challenge for Chemistry Department based on present resources and therefore putting deliverables been ready for breaker open at risk.

Cause : NR design documentation is scheduled for issued for all projects at the same time.
Potential impacts : Chemistry Control documentation preparation may be late affecting chemistry control during initial stage of layup.

Roger Daly Sergei Voitchenko 14-Sep-16

**Chemistry Control Procedural Review**

Risk/staffing requirements

- Exercise the option to involve ": Chemistry Support " Qualified OPG staff to perform Work Plans and Operating Manuals review. Assess availability of Chemistry qualified staff within OPG Nuclear and outside sources:
  - Regularly attending quarterly Chemistry Work Group Meeting and providing update on NR chemistry support requirements to CMWD manger - Continuous
  - Contract with Worley Parsons for 2015 is in place. Option to extend contract to 2015 and/or request "augmented staff " is under consideration - TCD 31 Dec 2015-In progress
  - Scope of support required from OPG Chemistry Technical and DND Chemistry Lab have been sent to Manager Darlington Chemistry and Environment.
  - Transfer plan NK38-PLAN-09701-10113-CHE-01 that identifies NR and DND Chemistry responsibilities is under review - TCD 30 June 2015 – in progress

-Chemistry Technician from DND Lab started to work 2 days per week from May 15.
- NR Chemistry Control Manual is under review to implement available design changes.
- Transfer plan NK38-PLAN-09701-10113-CHE-01 Rev.002 has been submitted for final approval by DND DOM ( May 2015)
- NR Chemistry technical second Sr. Engineer position has been approved and internal hiring process is in progress

### Defuelling Cost Could Increase

**Event:** The latest RQE operations budget holds OBU defuelling cost for the defuel campaign on all four units. During 4D planning the strategy and associated cost to complete the defuel was not fully developed so the estimate was less optimal.

- **Cause:** In order to reduce the potential cost of the defuel for RQE planning, an analysis was completed and a strategy selected that relies on the current 5 crew schedule for the first unit and a 4 crew shift schedule for the F/H department for subsequent units in order to optimize the business plan.
- **Impact:** Since an approved 4 crew schedule has yet to be approved for use there is a risk that defuel cost may increase if the approval is not obtained.

**Risk:** 759

### Potential Shortfall for Commissioning Support

**Event:** There is a risk that resource requirements for the return to service and commissioning phase of the project could exceed the NR O&M support capabilities.

- **Cause:** The O&M program has established support organizations based on estimated resources for the various bundles including RTS and commissioning.
- **Impact:** This would require the station O&M to mobilize to assist in preserving the RTS schedule.

**Risk:** 806

**For Internal Use Only**

Data Refreshed: 12-May-16 10:30 PM
Program: Operations and Maintenance - 10000

Refurbishment Maintenance - Milestone OP2070 Work Package Assessment Complete - At Risk

Based on data from the Assessment Status metric for week ending February 26, 2016, there is a risk that Refurbishment Maintenance will not meet the April 15 Work Package Assessing Complete milestone OP 2070. Maintenance is assessing at an average rate of 450 tasks per week. There are 5,300 tasks requiring assessment. Approximately 2,900 tasks have been added since December 2015. There are 20,000 Maintenance tasks in D1621 and DNRU2.

Refurbishment Chemistry & Environment - "Milestones OP2070 Work Package Assessment Complete" at risk

Based on data from March 29th there is a risk that refurbishment Chemistry & Environment will not meet the April 15 work package assessing complete milestone OP 2070. As of March 30th there was less than 20 hours of assessing time by a trained assessor from the chemistry laboratory. There are more than 150 tasks to be assessed by 15Apr2016. Laboratory assessing resources have not been available to be released to refurbishment per the ORU agreement. Scope additions are expected since there currently roughly the same number of tasks for this 3 year outage as there are for a normal 60 day outage. THM scope identification not well understood by individuals writing the CWP's and expecting to get support. There is a risk that there will be a lot of surprise work for laboratory employees if the number of tasks does not increase. Have been notified by R&FR that CWP preparation will not be complete until the end of May. The assessing milestone to have tasks assessed before all the work is identified is measuring to a metric well as CCF are in progress.

Approximately 2,500 tasks have been added since December 2015. There are 20,000 Maintenance tasks in D1621 and DNRU2.

Program: Operations and Maintenance - 73444

Non RQE identified cost for wireless integration of RP survey, shipment and Inventory data

The ability for field update to shipping paperwork, site inventory control of radioactive storage areas and up to the minute survey results can be greatly enhanced through using a vendor to network RP classroom and Mock-up facility. The Mock-up facility technology can replicate beam hazards which would be very beneficial to series testing and practical "exposure" technology can replicate beam hazards which would be very beneficial to series testing and practical facility.

Program: Planning and Control -

NRM Executed F&C and SRO Projects Exceed Forecasted Life Cycle Costs

The risk is that the forecasted life cycle costs for the F&C (Campus Plan) and SRO projects, including contingency, are understated due to an incorrect assessment of estimate class resulting in increased costs for those projects.

Ineffective use of project management control processes in NR pre-

The risk is that projects and modifications will not effectively apply scoping, scheduling, risk and cost management tools to successfully manage NR pre-requisite projects to meet program requirements.

**Program: Planning and Control - 10000**

#### Underestimation of Execution Phase Resources at RQE

The risk is that the RQE estimates for functional and OPG project support personnel requirements are understated as a result of more detailed understanding of the work and the resources required for execution gathered during the U2 RTE period. This would result in life cycle cost pushes to both project and functional support groups, including the Project Office, Operations and Maintenance, and Construction Management, as examples.

- **Event:** A delay in the U2 Zone 2 coffee shop start of refurbishment due to its impact on CFVS and Bulkhead.
- **Cause:**
  1. The U2 Zone 2 coffee shop has been provided to NR RP, however funding, engineering support and ESC pump for installation of time delay support planning and execution of Unit 3 and 1 ESC and STEP Installation.
  2. Station Maintenance support will continue to be needed for installation of time delay modification and commissioning support and ESC pump and valve overhauls.
- **Impact:**
  1. Impact on the Containment Filtered Venting System (CFVS) project and Containment Bulkhead Project, potentially causing a delay to the Refurbishment Outage.
  2. The NR RP work group had an approved SATM D-15-0310 for use of the space on U2 107.5 elevation R-203. This area was later revoked and provided to RFR as an equipment laydown area.

**Program: Prerequisite Projects - Program - 73380**

#### Poor EPC Vendor performance has required reconfiguration of U2 Zone 2 Coffee Shop for use as BPD and Instrument Island Area

The risk is that current public concerns regarding emergency preparedness/response plans or failure to move forward with waste management plans (e.g., DGR, or NWMO used fuel repository) is transferred to refurbishment and continued operations. This could delay Refurbishment execution.

- **Event:** The Radiation Protection BTU Field Unit requires a central location to distribute EPDs and organize daily work activities for the Radiation Protection Co-ordinators providing Service Protection coverage to Orange qualified RFR workers and non-RFR personnel during the Refurbishment of Unit 2. The NR RP work group had an approved SATM D-15-0310 for use of the space on U2 107.5 elevation R-203. This area was later revoked and provided to RFR as an equipment laydown area.

- **Cause:**
  1. Since the installation of CFVS along with STOP has already been committed to the CNSC to assure containment integrity for severe multi-Unit Beyond Design Basis Accidents (BDFA), a delay in STOP will delay the start of Refurbishment 2. If Unit 1 STOP cannot be installed in 2015 VBO, the final opportunity to do so is D1711. If the STOP installation coincides with bulkhead installation (i.e., with Unit 1 shut down), then the Unit 2 bulkhead may only be credited as a containment boundary: a) After 30 days into the Unit 1 Outage, OR, b) Unit 1 STOP is declared Available For Service before 30 days into the D1711 outage.

- **Impact:**
  1. The location of the trailer in the Unzoned area south of U2 and does not provide easy access for RFR and non-RFR projects to contact NR RP BTU. The U2 Zone 2 coffee shop is directly adjacent to the RFR PJB area and would provide excellent access to the area. Failure to provide a central path due to its impact on and/or refurbishment critical delays Project.

**Program: Refurbishment Execution -**

- **Event:** A delay in the Shield Tank Overpressure (STOP) project.
- **Cause:**
  1. Since the installation of CFVS along with STOP has already been committed to the CNSC to assure containment integrity for severe multi-Unit Beyond Design Basis Accidents (BDFA), a delay in STOP will delay the start of Refurbishment 2. If Unit 1 STOP cannot be installed in 2015 VBO, the final opportunity to do so is D1711. If the STOP installation coincides with bulkhead installation (i.e., with Unit 1 shut down), then the Unit 2 bulkhead may only be credited as a containment boundary: a) After 30 days into the Unit 1 Outage, OR, b) Unit 1 STOP is declared Available For Service before 30 days into the D1711 outage.

- **Impact:**
  1. Impact on the Containment Filtered Venting System (CFVS) project and Containment Bulkhead Project, potentially causing a delay to the Refurbishment Outage.

- **Event:** The Radiation Protection BTU Field Unit requires a central location to distribute EPDs and organize daily work activities for the Radiation Protection Co-ordinators providing Service Protection coverage to Orange qualified RFR workers and non-RFR personnel during the Refurbishment of Unit 2. The NR RP work group had an approved SATM D-15-0310 for use of the space on U2 107.5 elevation R-203. This area was later revoked and provided to RFR as an equipment laydown area.

- **Cause:**
  1. The Radiation Protection BTU Field Unit requires a central location to distribute EPDs and organize daily work activities for the Radiation Protection Co-ordinators providing Service Protection coverage to Orange qualified RFR workers and non-RFR personnel during the Refurbishment of Unit 2.

- **Impact:**
  1. The location of the trailer in the Unzoned area south of U2 and does not provide easy access for RFR and non-RFR projects to contact NR RP BTU. The U2 Zone 2 coffee shop is directly adjacent to the RFR PJB area and would provide excellent access to the area. Failure to provide a central path due to its impact on and/or refurbishment critical delays Project.

- **Event:** The Radiation Protection BTU Field Unit requires a central location to distribute EPDs and organize daily work activities for the Radiation Protection Co-ordinators providing Service Protection coverage to Orange qualified RFR workers and non-RFR personnel during the Refurbishment of Unit 2.

- **Impact:**
  1. The location of the trailer in the Unzoned area south of U2 and does not provide easy access for RFR and non-RFR projects to contact NR RP BTU. ## Risk Report by Project with Associated Actions

### Performance has required additional oversight during all phases, resulting in an increase in staff costs in OPG

Significantly involved in all phases (definition through execution) due to the vendor's inability to meet contractual commitments on cost, schedule and quality. This has required the Owner to build an oversight organization capable of supporting/executing the planning, execution and technical supervision of the work. Current RQE forecast of OPG manpower/cost assumes the EPC contractors for OPG will have the required capabilities to meet the contractual commitments on safety, quality, cost and schedule. Should the OPEX repeat itself on OPG, then significant schedule impact could occur and considerable qualified oversight resources would be required.

<td>Scale the Construction Oversight Group with the required quantity of specialists (Engineering/Procurement, Facilitators/Coordinators, welding, NDE, Quality and safety) outside of the project teams to ensure both objectivity of oversight and provide the needed support/guidance to the vendors. These refurbishment experienced specialists and support staff may not reside within OPG. This strategy will be more cost effective and scalable than building up the individual project teams.</td>
<td>Ken Hobbs</td>
<td>Robin Granger</td>
<td>15-Oct-16</td>
<td>Construction Oversight Group has been established with resource level and organizational make up approved. Required specialists, FME, Hoisting and Rigging, Pressure Boundary, Electrical, etc. Specific Construction Oversight qualification is developed and implemented. External Construction Oversight is now in place through Keiwit. Current organization will be tested through the 5 RTE Projects schedule for 2016 prior to breaker open. Lessons Learned will be incorporated prior to U2 breaker open.</td>
</tr>
</tbody>
</table>

### Key skilled craft resources not available when required for Units 3, 1, 4 Execution

Refurbishment Project Contractors will be unable to secure the number of required key skilled craft resources for Units 3, 1 and 4 execution like boilermakers, pipefitters, welders, millwrights and electricians as a result of attrition in the trades and other mega-project opportunities which may lead to schedule delays and cost overruns.

### EHS and other Vault Projects - Radiography Cannot be Completed on Schedule

The risk is that non-destructive examination (NDE), in the form of radiography, cannot be completed on schedule to verify nuclear class piping welds due to potential critical path impacts. Radiography is a high rad hazard and requires evacuation of the vault which may not be feasible due to critical path.

### Risk Report by Project with Associated Actions

#### Schedule Due to Critical Path Work (windows 104)

The work completed by the JV. This will lead to schedule impacts for the Emergency Heat Sink (EHS) project, valve rehabilitation, valve PML, and other projects to find time to complete radiography NDE.

Per SCR N 2016-02004 it was raised that radiography may not be able to be performed in the vault, to prevent impacts to critical path work being performed by the JV.

</tbody>
</table>

#### All work groups/ projects to id their vault radiography requirements to Dennis. Boyd - requested to determine other if other "non-radiography" technologies avail. Jan 15th, 2015. Did discuss this with vendors (ES Fox and AMEC) and we have a path forward to determine radiography amounts (still unknown as piping modelling is underway), I'll get you detailed drawings when the modelling is done. 4-Feb-2015 note: all in vault projects to strive to not have to radiograph. As JV is working 6x10h: Sunday will be "radiography day". 26-Apr-2015 note: unknown currently how much radiography is required...this will be known better as design progresses. Due date pushed to EHS 40% design complete date for follow up. Wender looking into other forms of NDE for pipe welds.

#### 31-Oct-16: Mitigate

- Banking strategy has been developed that would allow longer windows of no-fueling of up to 10 days (D-DA-37000-10015-R00). As well, the bulkhead installation co-Incides with the D1711 outage which eliminates the need to fuel unit 1. With potential changes to AWPP 007, this will maximize bulkhead installation time and minimize interruptions.
### Vendor CWPs are late and/or of poor quality impacting field execution with delays, cost over runs.

The risk is that Comprehensive Work Packages (CWP) may delay execution and/or rework required due to any of the following: late and/or of poor quality completion of detailed engineering and/or lack of qualified resources to prepare and review CWPs and/or lack of a defined detailed managed CWP process and/or not adhering to the managed CWP process.

#### TG-Turbine Generator Issues during dynamic testing

There is a chance that during the dynamic commissioning of the Turbine Generator we might encounter various issues. This issues might include but are not limited to various equipment performance issues such as equipment failure and maintenance related failures & software related issues such as software logic malfunctions, dynamic logic and parameter tune up issues. For this event only risks that have the most probability of occurring are considered and does not take under consideration any catastrophic scenario.

### Program: Refurbishment Execution - RF

#### Qualification of Existing Bellows

- The existing bellows are not currently qualified for the full post-refurbishment life. There is a risk (low probability) that qualification testing will fail which would require that all bellows be replaced (960 bellows per unit), resulting in increased cost and critical path duration. In addition, the lead time for the large quantities of bellows is substantial with ~6-12 months of float to the need date in the field. Test program is underway and results are expected within the time required to initiate procurement. The current bellows replacement tooling that is currently in the JV toolset is not efficient for a complete bellows replacement program which could be required if bellows qualification testing failed. The incremental tooling development would be required and a high level estimate of tooling development, manufacturing and testing timeframe is 24 months.

----------

#### Increased scope for fuel defect management

A significant fuel defect rate in the two refurbished units at Bruce has been reported, which was caused by debris (from unknown source).

Event: Remove defect fuel bundles (> 25 fuel bundles based on Bruce Power and Pt. Lepreau OPEX).

Impact: Potential shutting down of reactor for refueling, impacted on HTS RTS Commissioning, and may require mini-outage after AB start-up. It can potentially impact station capacity factor, and not meeting CNSC/OP&P requirements of iodine concentration.

Risk Report by Project with Associated Actions

Higher Than Expected CSA Demand for U134

The RQS Plan only reflected 8.5 FTE CSAs budgeted for 2018 and beyond due to a planning assumption that anticipated a drop in demand for CSAs post January 15, 2016 milestone: OP2360 – All Level 3 Schedules Quality Acceptance Complete. However, the “CSA Transition Plan” developed late in 2015, has clearly identified a need for 11 CSAs 2016-2023 in order to adequately support Pre-Req work and Unit Execution based on the OPEX and Lessons Learned based on the last 12 months. CCF R12 was generated to remedy this situation for U2.

There is a risk that U134 will experience the same higher demand and will require additional funds to remedy this demand. Among other details, some drivers for this increased need include:

1. Increased demand for dedicated CSA support for reviews, scheduling, and actions based on Pre-Req/Breaker Open for each of U134.
2. Increasing requests from Vendors to provide dedicated CSA support at vendor location, which take OPG CSAs away from crucial oversight and planning activities.
3. Increased demand for OPG-performed activities to be scheduled within the Integrated Level 3 schedule (REV C and REV 0).

The risk is that less than adequate schedule detail and work instructions developed to support the schedule development milestones (REV C and REV 0) from all schedule owners leads to less than adequate scheduled overviews. The current outage in Unit 1 they cleared the vault when they (had a HTS pump motor, presumably for concern that a dropped motor would actually penetrate the containment structure and kill people below it. We’re swapping 4 pump motors in DN2U2, which means 8 lifts (out and back in). Barring a change to the critical lift plan, that will drive 8 vault evaucations and depending on how pessimistic you are that could be anywhere from a half shift to a shift of critical path time lost for each such evolution. We currently don’t have any critical path time allocated for this activity.

An analysis is required to determine if this conservative action is really required, or if it can be eliminated from the lift plans for refurbishment units, rationale for eliminating the requirement should be documented in an approved report format.

Ryan Finnie

14-Jul-16

There are no Not Started, In Progress Actions associated with the risk.

Inadequate schedule detail and work instructions to support the schedule development milestone

The risk is that less than adequate schedule detail and work instructions developed to support the schedule development milestones (REV C and REV 0) from all schedule owners leads to less than adequately planned Execution Schedule.

There are no Not Started, In Progress Actions associated with the risk.

Refurbishment project not properly accommodated in the Generation Plan

Refurbishment project reflected on the long range generation plan only as a high level plans keeper. Outage schedule and planned generation does not currently take into account the shared O&M and vendor support for the outages at PNSG and DNGS.

Potential impact is an unavailability of critical resources or vendors during peak demands due to scheduled overlaps. This needs to be reflect in the generation plan as submitted to the OEB to ensure credible generation assumptions.

There are no Not Started, In Progress Actions associated with the risk.

Requirement for 24/7 PCC coverage

To maintain lower staff numbers, a days based rotation for PCC coverage is described. The schedule analysis is that neither in the OEB nor in the latest OPG report, does it reflect such a scenario.

There are no Not Started, In Progress Actions associated with the risk.

Report Owner: Karen Fritz

Data Refreshed: 12-May-16 10:30 PM
Risk Report by Project with Associated Actions

MTCL Staffing Estimate Uncertainty

The number of Work Control Team Leaders (WCTLs) is reduced from 12 to 8 in outages following the execution of the first unit. This reduction credits a increase in ease of implementation of the following units. This may be overly optimistic.

Program: Work Management - RF

RTS RTS Schedule Risk – Hot Conditioning with Fuel in Core

EVENT: The current base case is sequenced such that fuel is manually loaded in core and later Hot Conditioning is performed, which may not be an acceptable sequence if this results in deposits on the fuel bundle.

CAUSE: During Restart of Bruce Units 1 & 2, Hot Conditioning was performed with fuel in core using EDTA process. Deposits were seen on fuel bundles from both units, with hot conditioning being the probable cause of the deposits. Unit operation with fuel bundles that have deposits is not an analyzed configuration for the fuel. As such, the CNSC directed Bruce Power (see NK21-CORR-00531-10509) not to perform any Hot Conditioning on subsequent units with the fuel in core unless there is agreement with the CNSC. It cannot be precluded that a similar phenomenon could happen at Darlington. Darlington is using the conventional hot conditioning process not EDTA which was used at the Bruce.

Chemistry concerns with hot conditioning following ATC still need to be resolved. There is no current approved documentation supporting HC after the reactor is critical. Increased activated crud may result from performing HC while critical resulting in increased dose rates that affect worker safety and plant equipment lifecycle.

IMPACT: The current RTS sequence (hot conditioning with fuel in core) may not be acceptable if it is found that Hot Conditioning with fuel in core results in deposits on the fuel. This would be an unanalyzed configuration in the safety report and would result in diminished regulator confidence in the project and S-99 reportable events. Allowing deposits on the fuel must be precluded or dispositioned. A change in RTS sequencing may be required resulting in a 30-45 day extension to the current schedule.

**Title:** NUCLEAR PROJECTS RISK MANAGEMENT
1.0 DIRECTION

Risk management is a systematic approach to identifying, analyzing, and responding to project risks. The goal of risk management is to proactively identify and manage risks in order to deliver projects safely, with quality, on time and on budget. This document provides direction to projects for both day-to-day risk management activity as well as the risk management preparations for authorization packages presented at funding gates/committees.

2.0 SCOPE

A graphic depicting the “inputs to” and “outputs of” risk management activity that fall under the scope of this document is outlined below. The sections of this manual are structured in alignment with this diagram.

![Risk Management Process Diagram](image)

Figure 1: The Risk Management Process

2.1 Risk Management and Oversight Tool (RMO)

The Risk Management and Oversight (RMO) tool is an application project managers will use to perform risk management activity for projects. The Project Management Office (PMO) is the owner and administrator for this tool and provides training, support, and guidance to the organization. This manual does not include detailed direction for using the RMO tool. For details on how to use the RMO tool, refer to N-GUID-09701-10123, Risk Management and Oversight Tool.
2.2 PMO Role

The PMO Risk Department will provide guidance to the project managers in the application and interpretation of the requirements outlined in this manual. The support provided exists both in the day-to-day application as well during preparation of funding approval packages (e.g. Gate Review Board). The PMO risk department will perform oversight of the RMO contents on behalf of the Nuclear Projects organization and will prepare reports, metrics, self-assessments, and other such analyses from time to time to monitor the effectiveness and use of the processes outlined in this manual. Annually a consolidated report will be prepared incorporating a strategic review and identification of any corrective actions.

Additional project controls support and deliverables, where applicable, are outlined in the appropriate section of this manual.

3.0 RISK MANAGEMENT INPUTS

Risks to project objectives can be identified from a number of sources. If these sources of risk are not considered both in the development of the initial risk profile as well as during ongoing risk management activity the ability for the project manager and senior leadership to make informed decisions about the project may be adversely impacted.

3.1 Operating Experience (OPEX) and External Lessons Learned

OPEX is information gained through experience that should be retained for future use. Depending on the observation made, OPEX could be a valuable technique, a best practice or a successful outcome you wish to repeat or an undesirable result you wish to avoid. When applicable OPEX is recognized, the project manager is then equipped with the knowledge to incorporate it into their baseline cost and schedule or manage it as a risk.

The Nuclear Projects process complies with OPG N-PROC-RA-0035, Operating Experience Process. This base standard has an operational focus. For project risk management, the goal is to look beyond operational events and seek out events that have happened both in nuclear and non-nuclear projects that may present risks to the project that is being undertaken.

OPEX obtained through RA-0035 process is added to the RMO database by the PMO and dispositional by the designated department or project. Anyone with access to the RMO tool can add an OPEX event under the OPEX tab. The PMO can assist the project manager in searching for specific event types and populating the RMO OPEX library with new information that will be helpful to others.

Lessons Learned (LL) are similar to OPEX items, in that they have a foundation in past events. A lesson learned however goes beyond an individual event to provide key insights and clearly identify the causal factors that contributed to a positive or negative outcome. The RMO tool contains a searchable lessons learned library, with major lessons learned categorized as Programmatic Lesson Learned (PLL). Each PLL...
is assigned an owner within Nuclear Projects whose accountability is to ensure that proper actions are developed, assigned, and are monitored to completion.

3.1.1 Project Manager Direction

Project managers should be up to date on the content of the OPEX and LL libraries as they conduct their day-to-day risk management activities. Good practice would be to establish periodic reviews of OPEX and LL within their project teams during regular risk reviews.

Prior to any funding gate a detailed review of the RMO OPEX and LL library must be performed and any items that were considered in the preparation of the baseline cost and schedule or resulted in a project risks shall be identified. A summary of the review performed shall accompany the gate or funding approval package in the form of a narrative in N-FORM-11652, Nuclear Projects Risk Management Input Assessment.

PMO Role

The PMO Risk Department receives external OPEX from the central nuclear OPEX coordinator. The OPEX received has been pre-screened as per N-GUID-04947.02-10000 External Events Screening Guide and is determined to be relevant to Nuclear Projects. These items are populated in the RMO tool by the PMO risk department. The PMO risk department will also proactively seek out external and internal project related OPEX events through a variety of sources identified in Appendix A. The PMO risk department provides oversight support and disseminates significant information in real time through email communications. The PMO risk department creates programmatic lessons learned (PLL) based on significant OPEX and presents them to CARB.

3.2 Project Definition Rating Index (PDRI)

The Project Definition Rating Index (PDRI) is an industry best practice front end planning tool that helps assess the level of project scope definition and stakeholder alignment during the critical formative stages of the project. The objective of a PDRI is to identify gaps in scope definition early on, prior to committing significant funding to the project. The gaps in understanding or definition identified in the PDRI workshop shall be closed by the project manager prior to proceeding further (i.e. prior to submitting the funding package for approval). At minimum if the gaps cannot be resolved the project manager can use the insights gained in the PDRI session to inform the project risk register.

The requirement for a project to undertake a PDRI workshop is defined by the gating process. The PMO Risk Department can assist the project manager in executing a PDRI workshop by providing resources and facilitation.
3.3 Assumptions and Project Bases

Assumptions are factors in the planning process that are considered to be true, real, or certain, without proof or demonstration. Assumptions are not completely defined in project documents but are required in order to develop the cost and schedule estimates for projects.

Project bases are documented descriptions of how an estimate, schedule, or other plan component was developed and defines the information used in support of development.

To the extent possible when preparing funding approval packages, the use of assumptions shall be minimized. It is important when preparing the cost and schedule estimates to disposition assumptions so that the project plan being presented has been validated and is supported by project bases. Any residual assumptions that cannot be dispositioned or built into the cost and schedule as a project basis shall be entered into the RMO assumption log and reviewed during preparation of the project risk register. Assumptions are to be populated in the RMO tool, and can be initiated by any Nuclear Projects personnel with access. Project bases that are not documented in other project documents (such as the basis of estimate) shall also be documented in the assumptions log in the RMO tool.

3.3.1 Assumption Revision or Closure

Assumptions can be closed when they are no longer relevant or when they are known to be incorrect or invalid. New or modified assumptions that impact other projects directly, or those that are widely applicable (i.e. "program" level assumptions) shall be broadly communicated by the initiating project manager in order to bring awareness to those affected departments or projects. For example, an assumption pertaining to contracting or resourcing strategies may have a wide ranging impact on projects already in flight therefore strategic, effective communication is imperative.

3.3.2 Project Manager Direction

Prior to submission of funding approval packages, the project managers shall populate the assumptions log in RMO. These assumptions shall be assessed to determine if they introduce risk to the project and require entry to the project’s risk register. A summary of the assumptions made shall accompany the gate or funding approval package in the form of a narrative in N-FORM-11652, Nuclear Projects Risk Management Input Assessment.

The project managers shall keep up to date on the content of the assumptions log as they conduct their day-to-day risk management activities, and assess risks against assumptions made. Good practice would be to establish periodic reviews of the RMO assumptions log for any new programmatic assumptions made or any assumptions made for projects that may impact the subject project. The project manager shall re-validate their assumptions on a regular basis and at minimum at funding approval gates or when initiating the change control process.
3.4 Decisions

**Documented decisions form a part of the project basis.** Decision records are critical for maintaining an auditable trail for Nuclear Projects and assist in “telling the story” of the projects. In most cases, decisions exist in the form of approved documentation generated by following existing approved processes (the modifications and the engineering change control processes, Engineering or Operational Decision Making, for example). Decisions made under the execution of these processes do not need to be duplicated in the RMO tool.

Project decisions that should be entered into the RMO are those that are not covered by existing processes. These decisions tend to be strategic in nature and arise when there is not a clear path forward but rather a number of possible options to achieve the project’s objectives. Too often, these decisions are made informally without the appropriate authority and are not communicated effectively, resulting in adverse impacts on the projects. These decisions shall be documented in a DRAS *(Decision Record and Analysis Summary)* N-FORM-11390 and entered into the RMO tool once approved. A control document number shall be obtained for the DRAS and the DRAS shall be submitted to records in parallel with being added to the RMO decision log.

This decisions process and associated N-FORM is flexible and may be applied to provide structure to a number of different project departments for a number of different types of decisions. While all decisions documented in a DRAS shall be recorded in the RMO tool, this manual will not provide direction for all the various possible applications.

3.4.1 Project Manager Direction

There is no strict prescription or threshold for entering decisions in the RMO tool. If there is confusion regarding the appropriateness of preparing a DRAS, contact the PMO risk department for support and guidance. As a general rule, the project manager should use judgment and input decisions in the RMO tool if:

a) The decision forms a fundamental aspect of the project basis and is not documented elsewhere as part of approved project processes, and/or

b) The decision would assist external and internal personnel in understanding the rationale and the considerations made in establishing the project plan, and are not documented elsewhere as part of approved project process.

In all cases, decisions must be validated with sufficient authority to ensure prudence and facilitate alignment among multiple organizations. Where a decision has a financial impact, the DRAS approver must have the authorization to approve the decision based on OPG-STD-0017, Organizational Authority Register. At minimum, for decisions that impact (or have the potential to impact) other OPG organizations, the Stratum IV manager of that department, or their delegate, shall review and comment. It is the project manager’s accountability to ensure this happens. Any DRAS that results in a change of scope to the project must be submitted to the appropriate project review board/committee for authorization prior to approval. Any employee can initiate a decision in the RMO tool provided it is supported by an approved DRAS.
To the extent possible when preparing funding approval packages, the practice of documenting decisions is encouraged. The objective when preparing the cost and schedule estimates is to formally document decisions to support the project basis. A summary of the decisions made and recorded in RMO in the development of the project plan shall accompany the gate or funding approval package in the form of a narrative in N-FORM-11652, Nuclear Projects Risk Management Input Assessment. Good practice would be to establish periodic reviews of the RMO decisions log for any new decisions made that may impact the subject project and following up on any impacts if required.

Owners of the decisions recorded in the RMO tool shall review these decisions quarterly and update the project risk register as appropriate. Decisions that impact multiple organizations shall be broadly communicated by the decision owner in order to bring awareness to those affected departments or projects.

4.0 RISK MANAGEMENT

Project managers are accountable to apply the risk management (RM) practices identified in this section to their projects. The PMO Risk Department will provide tools, guidance, training, and support to the project managers.

The RM process includes the following fundamental steps:

(a) **Planning** – defining how to conduct risk management activities for the project or program.
(b) **Identification** – determining events that may affect the project objectives and documenting their characteristics.
(c) **Assessment** – analyzing and prioritizing identified risks based on probability and impact (qualitative), and estimating the potential cost and schedule implications of the risks to the approved objectives if they were to occur (quantitative).
(d) **Treatment** – determination of the most appropriate risk response to reduce threats to project objectives, or exploit opportunities to improve project performance.
(e) **Monitoring and Control** – implementing risk response plans, monitoring identified risks, identifying new risks, and evaluating risk process effectiveness throughout the project life cycle.

4.1.1 Risk Management Planning

A Risk Management Plan (RMP) describes how risk management responsibilities structured and performed. Each project should prepare a standalone RMP or have a section dedicated to risk management within its Project Management Plan (PMP). Where the project is a subset of a larger program, referencing the program RMP or PMP and documenting any specific project deviations or details to the parent plan is acceptable.
Included in RMPs are the following sections:

- **Risk Management Methodology** - defines the approach, tools, and data sources that may be used to perform risk management on the project.
- **Roles and Responsibilities** - defines the risk management leads, support personnel, and other team members including their responsibilities and accountabilities to ensure compliance with the risk management process.
- **Monitoring and Control** – definition of when and how often the risk management process will be performed, including the establishment of major risk management activities to be included in the project schedule. Monitoring and update frequencies will reflect the phase of the project life cycle (i.e. the execution phase will require a focused effort to stay on top of risks with more frequent updates).

### 4.1.2 Risk Identification

Risk identification is an iterative process because new risks may evolve or become known as the project progresses. The risk profile presented to support contingency development in a funding approval package is a “point-in-time” snapshot. Failure to perform ongoing risk management activity is negligent from a project management perspective and will result in adverse impacts to the individual project and the overall portfolio.

A number of techniques or forums may be used to identify risks. The project team and functional and external stakeholders should be involved in the process so they can develop and maintain a sense of ownership and responsibility for the risks and associated actions.

Tools and techniques to identify risks include, but are not limited to:

(a) Facilitated workshops  
(b) Structured Interviews with experienced project team members, stakeholders and SMEs.  
(c) Project Definition Rating Index (PDRI) Workshops  
(d) OPEX and Lessons Learned Review  
(e) Basis of Estimate (BOE) Review; review of assumptions and constraints in the BOE can be used as a source for risk identification.  
(f) Project Schedule Review; review of near critical, critical path and schedule float in schedule assumptions can be used as a source for risk identification.  
(g) Review of a standard risk breakdown structure for potential risks (Refer to Appendix C)

### 4.1.2.1 Common Pitfalls in Risk Identification

There are five common pitfalls in risk identification that leads to inefficiencies in managing risks:

(a) Identifying Risk Without Clear Project Objectives
Effective risk identification requires a high quality project plan with clearly defined cost, schedule, quality, and safety objectives. Without this, one cannot effectively identify risk to these objectives and items raised will be based in speculation and not facts. This can lead to initiating actions too early, team confusion, and create a perception that risk management is not an effective use of time or resources.

(b) The Presumption of Failure

Too often project and functional managers submit project plans (scope, cost, schedule, resources) for approval that they do not believe are reasonable and achievable. Further, a large risk register may be viewed as a means to indicate to the approval board that the project “is not easy” or has been unsuccessful in the past. This presumption of failure creates too many risks to effectively manage and a lack of clear prioritization for the team. A project risk register is not a repository to capture known shortcomings of an underdeveloped project plan.

(c) Identifying Issues as Risks

Issues are events that have 100% probability of occurring, or have occurred already and require resolution. As such, these are not preventable risk events but rather issues that should be addressed. Identifying issues as risks may distract the project managers and prevent them from focusing on the adverse impacts that are truly preventable.

(d) Business-as-Usual Risks

Events that will be addressed in the normal course of conducting work are termed Business-as-Usual items. These are items that have a process, plan or organization in place to address them, but the concern is that the execution may be “less than adequate”. Examples of poor use of Business-as-Usual risks include:

- “Project Managers may not meet milestones”.
- “Oversight plan may not provide complete details to provide guidance for oversight.”

In general, in order to be a risk there has to be impact to the objectives of the project plan. Business as usual items may truly present a risk to the project but the cause and the impact must be clearly identified in the risk description in order to be effectively managed.

(e) Vague or Misleading Risk Titles and Risk Descriptions

Risk titles that are vague or misleading may result in response plans that do not address the real risk that the project is facing.
4.1.2.2 Risk Titles

Risk titles describe the event and the context of the event.

“There is a risk of insufficient welders available <event> to support Execution <context>”

4.1.2.3 Risk Descriptions

Risk descriptions should be comprised of the risk event, the cause of the event, and the impact of the event on project objectives. The absence of any one of these critical items would preclude the item from being added to the risk register due to the inability to define a proper risk treatment.

“There is a risk of insufficient welders available <event> to support Execution due to competition with other large industrial projects in the province <cause>, resulting in a delay that will impact the critical path by 30 days <impact>”.

4.1.2.4 Opportunities

An opportunity is an event that, if it is implemented or occurs, increases the likelihood of achieving project objectives. An opportunity must demonstrate a clear benefit to achieving a project objective in sufficient magnitude to offset the risk presented by changing course. Opportunities identified in the SharePoint log “Opportunities Inbox” will be reviewed periodically by the PMO risk department and reported in the Risk Oversight Committee meetings for further consideration. In all instances where opportunities are identified as valid, they are to be pursued with focus (i.e. exploited to the extent possible).

4.1.3 Risk Assessment

4.1.3.1 Risk Register

A project risk register is a living repository of risks and is the project manager’s tool for identifying, assessing, monitoring, and updating project and program risks. The RMO tool contains the risk registers for all nuclear Projects – it is the working tool and also provides storage and backup of all risks and the associated logs. Risks included in the risk register should include all project life cycle risks that can be properly defined, without speculation, bias, or other such features identified in section 4.2.1.

4.1.3.2 Qualitative Scoring of Risks

Qualitative risk scores assist those inside and outside project team in quickly determining the biggest risks to the project. A “heat map” scoring approach is taken based on the probability of occurrence, schedule impact and financial impact of a risk (refer to Figure 2). After the probability, financial impact and schedule impact scores are determined the risk score is calculated by multiplying the probability score with the financial or schedule score, whichever is highest. The heat map scoring is standard for probability and schedule impact, but scaled to four categories for cost assessment criteria based on magnitude of the project and financial impact of the risk. This scaled
approach allows all project managers to qualitatively assess and prioritize risks to their project, with the understanding that a high risk to a $500K project is not as impactful as high risk to a $100M refurbishment project that has the same score.

![Impact Score Heat Map](image)

Figure 2: Generic Heat Map identifying the potential qualitative risk scores for Nuclear Projects

Refer to Appendix D for the risk assessment criteria/scale and guidelines for how to use the heat map.

### 4.1.3.3 Urgency

Urgency is another qualitative risk measure that assists project managers in prioritization. In the RMO, an urgency score shall be applied for each risk. The measure of urgency for risks in Nuclear Projects is as defined below:

<table>
<thead>
<tr>
<th>Urgency Score</th>
<th>Approximate Timeline for risk response</th>
<th>Urgency Assessment Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>&gt; 1yr</td>
<td>Risk treatment activities complete or risk not required to be addressed for the foreseeable future</td>
</tr>
<tr>
<td>2</td>
<td>6 months – 1 yr</td>
<td>Risk can be addressed in the long term and risk treatment will still be effective</td>
</tr>
<tr>
<td>3</td>
<td>1-6 months</td>
<td>Risk should be addressed in the midterm for risk treatment to be effective</td>
</tr>
<tr>
<td>4</td>
<td>Within 1 month</td>
<td>Risk must be addressed immediately for the risk treatment to be effective</td>
</tr>
</tbody>
</table>

### 4.1.3.4 Quantitative Risk Analysis

Quantitative risk analysis is the process of assigning a dollar value to the effect of identified risks on overall project objectives. Quantitative risk analysis is performed on risks that have a significant qualitative residual risk score and require contingency funding. Not all risks qualitatively scored and managed per this process will require contingency (refer to Section 5.1 for guidelines). Wherever possible, the estimating
4.1.4 Risk Treatment

Risk treatment requires effort to develop a plan to minimize the risk and implement response actions where appropriate. All risks in the risk register should have one of the following risk responses:

- **Avoid** – Obtain information to better define the risk source, eliminating the risk entirely. In this case the residual risk score should be reduced compared to the current risk score to reflect the level of confidence in the ability to avoid this risk.
- **Transfer** – Shifting some or all negative impacts of a threat to a third party (e.g. to a contractor via contract terms and conditions). If this response is chosen, the risk owner is still accountable to manage this risk on an ongoing basis. In this case the residual risk score should be less than the current risk score due to the consequence of the risk being transferred to a third party.
- **Mitigate** – Take actions to reduce the probability and/or impact of an adverse risk event to be within acceptable limits. In this case the residual risk score should be less than the current risk score due to mitigation actions being taken.
- **Accept** – Take no action and accept the possibility that the risk could occur. In this case the residual risk should reflect the current risk score, because nothing is being done to reduce the risk. Accepting risk may result in significant cost impacts, as such the risk owner is required to gain the endorsement of the responsible project director prior to selecting this response.
- **Monitor** – Periodically assess the risk through the normal course of project execution until, a) clear mitigating actions are identified, or b) a more appropriate risk response is identified. In this case the residual risk should reflect the current risk score, because nothing is actively being done to reduce the risk.

An informal cost-benefit analysis may be performed to evaluate the appropriate of the risk response. For example, if the cost to mitigate the risk is greater than accepting the probability and the impact of the risk “as-is”, then the risk response should be “Accept” and not “Mitigate”.

4.1.4.1 Evaluating the Effectiveness of Risk Responses

All risks in the risk register should have three risk scores:

(a) **Pre-Response Risk Score** – the score assuming that the risk will be accepted. This is a one-time assessment at the “point of discovery” of the risk.

(b) **Post-Response Risk Score** – the score of the residual risk assuming the risk response is completed successfully. This score is subjective and based on the confidence level of the risk owner in the effectiveness of their risk response. This post response score is a gauge of how manageable the risk owner believes the risk is.
(c) **Current Risk Score** – the score reflecting the current status of the risk. This is the primary measure of risk exposure for the purpose of planning and risk metrics/response analysis.

### 4.2 Risk Monitoring and Control

#### 4.2.1 Risk Reviews

The risk owner identified in the RMO tool has complete accountability for the content of their risks in the tool and for the implementation regular reviews of these risks. This is true even if they have delegated their authority to update or manage the risk to others. Each risk owner shall perform, at minimum, monthly risk reviews to:

- Ensure risk responses are optimal based on the latest information;
- Ensure mitigation actions are on track and status the actions in the actions log in the RMO tool and initiate new actions were warranted;
- Determine if the assumptions related to the risks are still valid and update in the Assumptions log in the RMO tool, if applicable;
- Determine if the risk characteristics have changed;
- Determine if new risks should be identified;
- Determine if risk has been realized or has expired and can be closed in the RMO Tool (with justification).
- Assess, modify and validate the risk score and any other applicable fields (such as owner, comments, etc.) in the risk register as required.

#### 4.2.2 Risk Reporting

Risk reporting is performed in line with monthly or quarterly reporting cycles. The content of risk reports can be taken directly from the RMO Tool using the Business Intelligence (BI) report engine. For senior management and external stakeholder reporting, the PMO risk department may make the risk wording in the RMO tool more concise to align with the level of detail required in the specific reporting vehicle.

Examples of reporting vehicles for risk include:

- Risk Dashboard
- Key Risk Area Summary Report
- Program Reports
- Quad Charts
- NOC (Nuclear Oversight Committee) Reports
- Quarterly ERM (Enterprise Risk Management) Reports
- User Reports (“boxed” reports) from BI
4.2.3 Risk Metrics

In order to assess the effectiveness RM in Nuclear Projects, the PMO risk department will prepare metrics. The Risk Dashboard will contain the primary metrics that will identify trends and allow comparisons of risk across the projects, functions, and Nuclear Projects as a whole. As risk management is a qualitative measure, with no focus on achieving a quantitative “target”, metrics prepared shall be geared towards process compliance only. As the risk management practice in Nuclear Projects evolves and matures, additional metrics may be introduced.

4.2.4 Key Risk Areas

Key Risk Areas are used to group risks from different projects which may impact major, overarching Nuclear Projects objectives. Each Key Risk Area is assigned a senior management sponsor who is responsible for providing oversight of the Key Risk Area to ensure that it is effectively being managed as a whole. Key Risk Areas are intended to provide a cross-cutting look at high level risk areas which need increased visibility and attention within Nuclear Projects. It is important to note that not all risks in the RMO Tool need to be categorized under a Key Risk Area.

The Sponsor of a Key Risk Area is required to champion the risk management process to ensure that, as an aggregate, the Key Risk Area is being addressed *efficiently and effectively* in order to minimize impact on NR objectives. It is expected that the Key Risk Area Sponsor is:

- **Knowledgeable of and able to communicate** the general “health” and status of the Key Risk Area at the R-ROC and in other major communication vehicles, as required.
- **Proactive in initiating change in their Key Risk Area** to improve the efficiency and effectiveness of the NR response.
- **Available to provide the strategy/rationale** for the requested change to the individual risk owners, when required.
- **Rigorous in follow up** to ensure sponsor directives have been implemented.

5.0 RISK MANAGEMENT OUTPUTS

Effectively managing the outcomes of realized risks is critical to recovering project objectives. Ineffectively managing realized risks can create a snowball effect where distractions result in loss of focus on the remaining risks leading to their eventual impact on the project.

5.1 Contingency

Contingency is a tool to manage uncertainty and risk throughout the life of a project. The contingency reserve should be proportional to the project size, duration, complexity, risk exposure and tolerance, prior experience with the work, and
confidence levels set by management. **Contingency is not a tool to compensate for an underdeveloped project plan.**

Contingency covers the *known unknowns* in a project. Specifically, these are the uncertainties associated with a schedule and cost estimate, as well as the discrete risk events that impact the objectives defined by these fundamental products. Any contingency development exercise requires a high quality, vetted estimate and schedule. Without a high quality project plan, one cannot effectively identify risks or the level of uncertainty. Without a high quality risk register and well understood uncertainty profile, one cannot effectively calculate an appropriate contingency estimate. It is the expectation that the project plan presented for contingency analysis is reasonable and achievable and endorsed by necessary stakeholders during its development.

The PMO risk department will work with the project managers to develop an appropriate project contingency estimate. Contingency should be calculated in advance of submitting the funding approval package to the approving board/committee but after the development of the cost and schedule estimate. Once approved, ongoing contingency adequacy reviews should be performed through the PMO risk department in line with Section 5.1.5.

Management Reserve (MR) is an amount of the project’s calculated contingency withheld for management control purposes.

5.1.1 Discrete Risks

Risk events have cost, schedule, quality, or safety impacts, all of which can be characterized into potential financial consequences.

The cost score should indicate the direct cost impacts resulting from the realization of the risk exclusive of time dependent costs. Using three point estimates to establish ranges of possible outcomes for risks, the impact of the discrete risks can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these specific events.

The schedule score identified on the risk register indicates the impact to a project’s critical path, usually expressed in “days” and easily translated to dollars based on burn rates. This approach to schedule contingency (i.e. burn rate x days delay) is high level approach and is less precise than range analysis on a CPM schedule, which is the preferred method. This approach uses a Monte Carlo methodology and assigns three point estimates to critical path project activities considering the risks identified.

5.1.2 Cost Estimate Uncertainty

Cost estimate uncertainty is a function of estimate class and is an implicit risk to project objectives. For example, a point estimate built upon conceptual design information is only assumed accurate within a very broad range and may have many potential outcomes. Uncertainty in estimates is expected to decrease over time as the project definition improves and the project matures. Appendix E Table 1 identifies the ranges of uncertainty associated with estimate class definition as defined by AACE.
The determination of the size of the contingency fund must take into the account the estimate accuracy and project phase.

Cost growth areas typically covered by estimating uncertainty contingency are more general than those covered by discrete risks, and include items such as:

- Minor errors in omissions in the estimating process (e.g. precise quantity is only known during execution)
- Variability of productivity (e.g. estimating based on execution in the summer, but actually executed in the winter)
- Variability in wages (e.g. labour agreements expiring during execution)
- Variability in prices (e.g. material prices assumed)

Effort must be made to ensure the factors covered by cost estimating uncertainty are not duplicated in the project risk register. Using three point estimates, the impact of the cost estimate uncertainty can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these events.

Estimate uncertainty does not capture variability in scope.

### 5.1.3 Risk Tolerance and Confidence Levels

Risk tolerance is the degree, amount, or volume of risk that an organization is willing to accept. Nuclear Projects risk tolerance is informed by a number of contributors including the experience and instinct of the project management team, past performance of similar projects, and stochastic methods.

In stochastic risk analysis, it is often expressed in a percentage value called a confidence level. For example, a P50 value on a Monte Carlo contingency estimate means that a project manager can be 50% confident that the contingency allocated is sufficient to address the risks and uncertainties defined for the project.

In managing a portfolio or program of projects, the concept of confidence levels can be useful in managing contingency funds. For example, for a given project’s contingency analysis, the following structure could be employed to support the approval authority of contingency funding. This is for illustrative purposes and may be applied differently for different funding streams and risk tolerances within the Nuclear Projects organization.

<table>
<thead>
<tr>
<th>Contingency $ at Confidence Level</th>
<th>Up to P50 (Current Phase Risks and Uncertainties)</th>
<th>Up to P50 (Future Phase Risks and Uncertainties)</th>
<th>P50 → P70 (All Risks and Uncertainties)</th>
<th>P70→P90 (All Risks and Uncertainties)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Treatment Upon Project Approval to Proceed</td>
<td>Released to Project</td>
<td>Allocated to Project but not Released</td>
<td>Allocated to Project but not Released</td>
<td>Allocated to Management Reserves</td>
</tr>
</tbody>
</table>
5.1.4 Probabilistic Analysis of Uncertainties

Monte Carlo simulation is a form of probabilistic analysis. It is a method to predict the impact of defined risks and uncertainties using project simulations. Gathering the three point estimates required for the Monte Carlo method can be quick and simple or rigorous, and should be commensurate to the overall magnitude or cost of the project. For example, small projects can use the projects manager’s judgment for inputs but large projects should be done with rigor and inputs from knowledgeable personnel. Poor quality inputs to the Monte Carlo (including choosing a misrepresentative probability distribution, or omissions of key risks) will produce misleading results – “garbage in, garbage out”.

The PMO risk department will perform the Monte Carlo analysis for risk and uncertainty inputs defined by the project manager. All contingency requests in support of funding approval packages are required to have a supporting Monte Carlo analysis, unless an exception is approved by the Director of the executing Nuclear Projects organization.

The general steps to executing the Monte Carlo contingency analysis are as follows. The PMO risk department can help provide direction and guidance to project teams where required:

(a) Confirm the basis of analysis. The project scope, schedule, and estimate should be well defined/finalized with minimal anticipated changes.

(b) Conduct risk screening to determine which risks are warranted to have contingency allocated against them. Not all risks are suitable for contingency allocation. Appendix E Table 2 provides a guideline on how risk screening should be conducted.

(c) Gather inputs for probabilistic analysis. This involves obtaining three point estimates (Most Likely, Optimistic, and Pessimistic) for residual risk impacts, cost uncertainty, and the logic tied critical path schedule activities.

(d) Run Monte Carlo simulations using software and analyze the results. Results will be presented as S-Curves or in other tabular forms/reports generated from the Monte Carlo tool.

(e) Determine the size of contingency required for the determined level of confidence.

(f) Reassess the inputs if required based on the outcome of the analysis and iterate steps (a) through (e).
5.1.5 Monte Carlo Analysis - Limitations

Monte Carlo project predicts the impact of the identified risks and uncertainties by running simulations to identify the possible outcomes of the project. This technique helps in forecasting the likely outcome of a project, thereby helping decision makers and project managers make informed decisions.

*Monte Carlo contingency analysis is not intelligent. It will not compensate for omissions or errors in the risk registers or estimates that are submitted for analysis. The output of a Monte Carlo considers only those risks and uncertainties the project manager has identified as an input to the process.*

5.1.6 Contingency Adequacy Review

The owner of contingent funds should re-evaluate the amount of contingent funds required as the project progresses. Contingency funds defined in funding approval packages are "point-in-time" estimates that reflect the project risk profile in that instance. As the project progresses, risks will be retired and new risks will emerge. It is critical that the contingency estimate is updated to reflect this and maximize the organization’s flexibility in managing these funds.

Contingency reviews should be conducted at the following checkpoints:

(a) Gate submission, including gate refreshes; BCS submission or superseding BCS submission
(b) Upon initiation of the project change control process;
(c) Release planning;
(d) Risk realization, especially a risk with high demands for funds;
(e) Unexpected event requiring high demands for funds;
(f) Significant change in the risk register;
(g) Significant deviation from the planned usage of contingency
(h) Alongside regular cost forecasting as defined by the PMO cost control department.

Note that the contingency adequacy review (or contingency assessment during normal forecasting activity) may reveal that there is too much contingency or not enough contingency allocated to the project. The project manager should return contingent funds that are no longer required via change control. If additional funds beyond what has been approved at the gate or release are required, then the function manager or project manager should request additional funds via change control process.
5.1.7 Refurbishment Contingency Development

All projects being executed within the Nuclear Projects organization, including refurbishment projects, are required to comply with this manual. However, for Nuclear Refurbishment, a white paper will prepared for each release period detailing how the contingency estimate is assembled. This white paper will be governed by this manual but will contain sufficient detail and additional considerations commensurate to the magnitude of the project.

5.2 Internal Lessons Learned

Internal lessons learned (ILL) are valuable because they provide real time, directly applicable experiences that other project managers can use when establishing their project plans. ILL usually take the form of detailed reports prepared upon project completion as defined in the modifications process. While this is valuable the objective of the ILL process is to share lessons both large and small in an effective way with minimal administration. Management and documentation of ILL is conducted electronically in the RMO Lessons Learned library.

ILL entries can be generated by Nuclear Projects staff for the purposes of sharing non-confidential OPEX and Lessons Learned from their department, project, a specific task, pre-post job debriefings, oversight activity, benchmarking trips, meetings, human performance observations or any other source.

5.2.1 Project Manager Direction

All project managers shall proactively document important lessons learned throughout the project life cycle to support improved project performance within the Nuclear Projects organization. Project managers will notify the PMO risk department to ensure lessons are documented and disseminated properly to increase awareness among the Nuclear Projects organization and improve management decision making.

PMO Role

The PMO Risk Department actively solicits real-time feedback on ILL throughout the organization, ensures accessibility to all members of the project and ensures standards, quality and completeness is accomplished. PMO Risk Department will provide simple templates for the project management team and prepare communication products (reports, emails, articles) for dissemination to the Nuclear Projects organization and its vendors.

5.3 Issues Resulting from Realized Risks

An issue is defined as a point or matter in question or in dispute. For projects, issues that arise usually surface gaps that must be addressed in order to achieve project safety, quality cost, and schedule objectives. Project issues can occur when risks are realized, assumptions made during the development of the project plan are
Nuclear Projects Risk Management

Proven to be invalid, or as the result of project authorization to proceed at risk with an underdeveloped plan.

Issues are not the normal challenges encountered in the progression of project planning and execution. Similar to risks, issues generated from realized risks – as defined in this manual – must demonstrate the potential to impact approved project objectives.

5.3.1 Project Manager Direction

Management of issues resulting from realized risks have one of two outcomes:

- A recovery plan is prepared and implemented with the target of achieving the approved plan, or
- The issue cannot be recovered and impacts the ability to execute the approved plan, resulting in a need to modify the plan (i.e. move milestones, increase costs beyond contingency).

When an issue of this type arises a Station Condition Record (SCR) shall be raised to document the issue as an adverse condition. In most cases this SCR will be trended D4 and closed out to recovery actions input to the RMO action log or to the change control process, as appropriate, wherein the issue will be managed to closure. Any actions generated in the RMO action log associated with an issue of this type shall reference the SCR. As defined by the requirements of the SCR process, and depending on the severity of the issue, actions inside the SCR process may be required. In this scenario, the actions do not need to be duplicated in the RMO actions log.

The project manager, depending on the severity and possibility of repeat occurrence, shall work with the PMO risk department to generate an internal lesson learned for distribution by the PMO.

5.4 Actions

Project actions not included in an existing managed system (project schedule, business plan, action tracking, etc.) will be documented and managed in the RMO action log. This action log can take the place of Microsoft excel or word files that project managers may be using to track actions.

Nuclear Projects action sources should be diverse and comprehensive and may include, but are not limited to, meeting actions, audit response actions, actions to mitigate risks, actions to validate assumptions, actions arising from assumptions, decisions, issues, oversight, OPEX and lessons learned implementation actions. Actions that are part of the normal course of executing project work such as day to day individual accountabilities and “business as usual” actions should not be included in the log.
5.4.1 Reporting

User reports can be generated by anyone at any point in time. These online business intelligence (BI) reports may be communicated from time to time in meetings or other forums. PMO risk department will administer these reports and facilitate project team access to them, in real time. Change to reports will occur from time to time as required.

6.0 ROLES AND ACCOUNTABILITIES

6.1.1 Senior Vice President and Vice Presidents in Nuclear Projects

Champion the risk management process in Nuclear Projects.

6.1.2 Project Managers and Directors

Apply this manual to all projects being executed by the Nuclear Projects organization.

6.1.3 Project Team

Support project managers and directors through application of this manual.

6.1.4 PMO Risk Department

Support project team members in the application of this manual and the RMO tool. Maintain this manual and provide guidance, training, and support to project teams. Support Nuclear Projects executives by providing oversight and reporting of the risk management program in Nuclear Projects.

Appendix F: Outputs of the Monte Carlo Method

Several standard outputs are available to provide project managers with insights to cost, and even schedule predictability in their projects. These graphical representations of results allow for robust means of communicating risk, and provides additional data to support decision making and identify the possible outcome of decisions.

Figures F-1 and F-2 are graphs depicting the results of a Monte Carlo simulation defining the probability distribution of cost and schedule outcomes based on input assumptions. This type of information is useful for understanding the expected cost/duration and the range/dispersion of the projected cost and durations.

![Figure F-1: Sample Probability Mass Function on Project Costs](image1.png)

![Figure F-2: Sample Probability Mass Function on Schedule Duration](image2.png)

Confidence in Cost or Schedule

The cumulative probability functions shown in Figure F-3 provide the same information shown in Figure F-1, but in a cumulative manner. The cumulative functions provide a quick reference for the mean (P50) and a confidence level in the estimate or schedule.
Title: NUCLEAR PROJECTS RISK MANAGEMENT

Identification of Risks with the Greatest Impact

Sensitivity analysis is a primary modelling output that can be used in the valuation of the impacts of individual risks. Figure F-4 Sample Sensitivity Analysis on Project Risks provides a sensitivity analysis in the form of a “tornado diagram”. Tornado diagrams depict the influence of individual risks and highlight the greater contributors to the overall risk. Using this information, project managers or function managers can spend more effort on mitigating the risks that has the higher impact on the success of the project/function.

Figure F-4: Sample Sensitivity Analysis on Project Risks
Appendix G: Risk Management Process
Refurbishment Readiness for Execution

Roy Martin
April 26, 2016
Refurbishment Ready for Execution

- Completion of the Definition Phase
  - RQE delivery
  - Execution Organization implementation

- Readiness to Execute Plan
  - Preparing of Processes for testing
  - Implementation of the RTE Test period work
  - Table-Top exercises for the balance of Processes
  - Lessons Learned implementation and Process Adjustment
  - Change Management throughout
Readiness to Execute Plan Periods

- Plan Periods
  - Lead-up Period (Complete)
    - Develop the test plans for the Test Period, and define ‘table top’ exercises to test those plans, processes and activities that can’t be directly tested during the implementation of the Test modifications
  - Pre-test Period (Complete)
    - Refine work programs and ‘proxies’ for the test period, conduct challenge meetings and indoctrinate the Execution team on the RTE purpose
    - Preparation for the for the RTE field work
  - Test Period (February 2016 – mid-June 2016)
    - Execute the planned field work activities and ‘table-top’ exercises
    - Develop the basis of information for conducting extensive lessons learned reviews focused improvements and corrections to training, work processes, team dynamics and worker and team behaviours
  - Implementation of Lessons Learned (June 2016 – October 2016)
    - Make the identified changes based on vetted results from the Test Period
    - Conduct change management to ensure that all part of the integrated execution are practicing the changes in their work
Readiness to Execute Plan Periods

- Plan Periods
  - Lead-up Period (Complete)
    - Develop the test plans for the Test Period, and define 'table top' exercises to test those plans, processes and activities that can’t be directly tested during the implementation of the Test modifications
  - Pre-test Period (Complete)
    - Refine work programs and ‘proxies’ for the test period, conduct challenge meetings and indoctrinate the Execution team on the RTE purpose
    - Preparation for the for the RTE field work
  - Test Period (February 2016 – mid-June 2016)
    - Execute the planned field work activities and ‘table-top’ exercises
    - Develop the basis of information for conducting extensive lessons learned reviews focused improvements and corrections to training, work processes, team dynamics and worker and team behaviours
  - Implementation of Lessons Learned (June 2016 – October 2016)
    - Make the identified changes based on vetted results from the Test Period
    - Conduct change management to ensure that all part of the integrated execution are practicing the changes in their work
RTE Example Review

Title: Readiness to Execute Plan
Rev #: 2
Rev Date: Apr 25, 2016
Data Date: Apr 25, 2016
Page: 9 of 10
Board Staff Interrogatory #74

Issue Number: 4.3

Issue: Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

Interrogatory

Reference:

Ref: Exh D2-2-11, Attachment 3, page 10

In her report, Dr. Galloway states that “[t]he Facilities and Infrastructure Projects (F&IP) and Safety Improvement Opportunities (SIO) were not necessarily completed per the initial planned schedule and estimate, however I did not find any fundamental issues that would impact the Program execution.”

Please explain why OPG has such a high level of confidence in the forecasted schedule and budget for the remaining work in DRP when OGP was unable to complete the required preliminary work on budget and on schedule?

Response

Please refer to the answer to Ex. L-4.5-1 Staff-78, where OGP details the application of lessons learned from the Heavy Water Facility project to the other Darlington Refurbishment Program projects. Exhibit L-4.5-1 Staff-78 also explains that there are significant differences between the Darlington Refurbishment Program projects during the Execution Phase (which will primarily be completed on in-station components and equipment) and the Facility and Infrastructure Projects (F&IP) and Safety Improvement Opportunities (SIO), many of which were new construction, first-of-a-kind for OPG and the Darlington site, and involved excavations.

OPG also notes that, while some of the F&IP and SIO did go over budget and schedule, others were completed on schedule and budget.
Board Staff Interrogatory #75

Issue Number: 4.3
Issue: Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

Interrogatory

Reference:
Ref: Exh D2-2-11, Attachment 3, page 53 Ref: Exh D2-1-3, Attachment 25, page 23 Ref: Exh D2-2-8, Attachment 1, page 7

Dr. Galloway in the first reference above, states that she found the Release Quality Estimate to be a Class 3, which according to the second reference above means that there is an expected accuracy range of -20% to +30%. The third reference states that OPG has determined the amount of contingency required to deliver the project, and produced a high confidence (P90) schedule.

Please reconcile a Class 3 estimate with P90, a 90% confidence that the contingency is appropriate and the schedule will be met.

Response

Please note that the range for a Class 3 Estimate referenced in Ex. D2-1-3, Attachment 25, p. 23 are the larger ends of the low and high Class 3 Estimate ranges. As shown in Ex. D2-2-8, Chart 1, p.3, the AACE expected accuracy ranges for a Class 3 Estimate are: Low -10% to -20%; High: +10% to +30%.

The Class of Estimate and the confidence level determined through detailed risk assessments and contingency development are not the same.

The Class of Estimate refers to the expected uncertainty range of the base cost estimate excluding contingency, and is determined by assessing the amount of work, particularly the level of project definition, which was completed in order to develop the estimate. It means that, over a large sample of projects which achieved a Class 3 estimate before execution, one would expect the actual costs of those projects to fall within a range of -10% to -20% to +10% to +30%. In OPG’s case, the Release Quality Estimate (RQE) development process included completion of the detailed engineering, evaluations of actual durations to perform tasks on the reactor mock-up, detailed resource estimates, and many other factors which would support a conclusion that the RQE was at least to a Class 3 estimate quality.

OPG’s contingency development process is explained in detail in Ex. D2-2-7. It includes the assessment of (1) cost estimate uncertainty, (2) schedule estimate uncertainty, and (3) discrete risks. It utilizes range estimates for projects within the major work bundles and

Witness Panel: Darlington Refurbishment Program
functional support costs, as well as range estimates for durations of critical path activities on
the schedule. It also involves assessing the probabilities and consequences of discrete risks.
These inputs are then processed through a Monte Carlo simulation which simulates the
outcome of the project thousands of times and produces an output which informs
management as to the level of contingency (both cost and schedule) which would be
required to give a particular confidence level that the actual cost of the project would be
expected to be below a certain value. This is the basis for OPG’s determination that, with
$1.7B (2015$) of contingency added to the base cost estimate, there is a 90% probability
that the Darlington Refurbishment Program’s actual costs would be below $12.8B.

Please note also that the $1.7B (2015$) in contingency represents approximately 20% of the
going forward costs for the Darlington Refurbishment Program, and approximately 31% of
the costs of the project bundles. Therefore, the contingency amount as a percentage of the
Darlington Refurbishment Program costs is in the expected range for a program with a Class
3 estimate.
